Low Memory Accessors Reference

Framework:	CoreServices/CoreServices.h
Declared in	LowMem.h

Overview

Note: This document was previously titled *Carbon Specification for Low Memory Accessors*.

Low-memory accessors are functions you can use to obtain or update information stored in low-memory variables. In general, don't think of the values returned by low-memory accessors as residing in low memory—think of them as global information for a process, possibly associated with a specific manager or service, that is set or returned by Mac OS X. These functions allow you to access useful system information (such as the location of the mouse) stored as global variables in so-called "low memory."

The practice of accessing low memory directly was questionable in earlier versions of Mac OS, and certainly is not suggested now. In some cases, better, safer functions exist in other interfaces for obtaining the same information. To facilitate the porting of legacy applications, Carbon supports many of the low-memory accessors. However, you should always avoid using low-memory accessors if there are direct calls to obtain the same information.
