## Overview

An `NSOpenGLView` object maintains an `NSOpenGLPixelFormat` and `NSOpenGLContext` object into which OpenGL calls can be rendered. The view provides methods for accessing and managing the `NSOpenGLPixelFormat` and `NSOpenGLContext` objects, as well as notifications of visible region changes.

An `NSOpenGLView` object cannot have subviews. You can, however, divide a single `NSOpenGLView` into multiple rendering areas using the `glViewPort` function.

When creating an `NSOpenGLView` object in Interface Builder, you use the inspector window to specify the pixel format attributes you want for the view. Only those attributes listed in the Interface Builder inspector are set when the view is instantiated.

**Note:** In versions of the Xcode Tools that shipped prior to Mac OS X v10.4, the Interface Builder inspector does not list any pixel format attributes for `NSOpenGLView`.

## Tasks

### Initializing an `NSOpenGLView`

- [initWithFrame:pixelFormat:](#) (page 8)  
Returns an `NSOpenGLView` object initialized with the specified frame rectangle and pixel format.

### Managing the `NSOpenGLPixelFormat`

- + [defaultPixelFormat](#) (page 7)  
Returns a default `NSOpenGLPixelFormat` object.
- [pixelFormat](#) (page 9)  
Returns the `NSOpenGLPixelFormat` object associated with the receiver.
- [setPixelFormat:](#) (page 11)  
Sets the receiver's `NSOpenGLPixelFormat` object to the specified object.

### Managing the `NSOpenGLContext`

- [prepareOpenGL](#) (page 9)  
Used by subclasses to initialize OpenGL state.
- [clearGLContext](#) (page 7)  
Releases the `NSOpenGLContext` object associated with the view.
- [openGLContext](#) (page 8)  
Returns the `NSOpenGLContext` object associated with the receiver.
- [setOpenGLContext:](#) (page 10)  
Sets the `NSOpenGLContext` object associated with the receiver.

### Managing the Visible Region

- [reshape](#) (page 10)  
Called by Cocoa when the view's visible rectangle or bounds change.
- [update](#) (page 11)  
Called by Cocoa when the view's window moves or when the view itself moves or is resized.

## Class Methods

### defaultPixelFormat

Returns a default NSOpenGLPixelFormat object.

```
+ (NSOpenGLPixelFormat *)defaultPixelFormat
```

#### Return Value

A pixel format object with no attributes set.

#### Discussion

Typically used with the initializer `initWithFrame:pixelFormat:` (page 8), this object has no attributes set.

#### Availability

Available in Mac OS X v10.0 and later.

#### See Also

- [pixelFormat](#) (page 9)
- [setPixelFormat:](#) (page 11)

#### Related Sample Code

[LiveVideoMixer2](#)

[LiveVideoMixer3](#)

[QTQuartzPlayer](#)

[Video Hardware Info](#)

[WhackedTV](#)

#### Declared In

`NSOpenGLView.h`

## Instance Methods

### clearGLContext

Releases the NSOpenGLContext object associated with the view.

```
- (void)clearGLContext
```

#### Discussion

If necessary, this method calls the `clearDrawable` method of the context object before releasing it.

#### Availability

Available in Mac OS X v10.0 and later.

#### See Also

- [openGLContext](#) (page 8)
- [setOpenGLContext:](#) (page 10)

**Declared In**

NSOpenGLView.h

**initWithFrame:pixelFormat:**Returns an `NSOpenGLView` object initialized with the specified frame rectangle and pixel format.

```
- (id)initWithFrame:(NSRect)frameRect pixelFormat:(NSOpenGLPixelFormat *)format
```

**Parameters***frameRect*

The frame rectangle for the view, specified in the coordinate system of its parent view.

*format*The pixel format to use when creating the view's `NSOpenGLContext` object.**Return Value**An initialized `NSOpenGLView` object, or `nil` if the object could not be initialized.**Availability**

Available in Mac OS X v10.0 and later.

**See Also**+ [defaultPixelFormat](#) (page 7)**Related Sample Code**

VBL

**Declared In**

NSOpenGLView.h

**openGLContext**Returns the `NSOpenGLContext` object associated with the receiver.

```
- (NSOpenGLContext *)openGLContext
```

**Return Value**

The OpenGL context object of the receiver.

**Discussion**

If the receiver has no associated context object, a new `NSOpenGLContext` object is created and returned. The new object is initialized with the receiver's pixel format information.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [clearGLContext](#) (page 7)
- [setOpenGLContext:](#) (page 10)
- [pixelFormat](#) (page 9)

 QTCoreImage101

**Declared In**

NSOpenGLView.h

**pixelFormat**

Returns the NSOpenGLPixelFormat object associated with the receiver.

- (NSOpenGLPixelFormat \*)pixelFormat

**Return Value**

The receiver's pixel format object.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- + [defaultPixelFormat](#) (page 7)
- [initWithFrame:pixelFormat:](#) (page 8)
- [setPixelFormat:](#) (page 11)

**Related Sample Code**

 QTCoreImage101  
 TexturePerformanceDemo  
 TextureRange

**Declared In**

NSOpenGLView.h

**prepareOpenGL**

Used by subclasses to initialize OpenGL state.

- (void)prepareOpenGL

**Discussion**

This method is called only once after the OpenGL context is made the current context. Subclasses that implement this method can use it to configure the Open GL state in preparation for drawing.

**Availability**

Available in Mac OS X v10.3 and later.

**Related Sample Code**

CIVideoDemoGL  
 QTCoreImage101  
 QTCoreVideo103  
 QTCoreVideo202

WhackedTV

**Declared In**

NSOpenGLView.h

**reshape**

Called by Cocoa when the view's visible rectangle or bounds change.

- (void)reshape

**Discussion**

Cocoa typically calls this method during scrolling and resize operations but may call it in other situations when the view's rectangles change. The default implementation does nothing. You can override this method if you need to adjust the viewport and display frustum.

**Availability**

Available in Mac OS X v10.0 and later.

**Related Sample Code**

CIVideoDemoGL

NSOpenGL Fullscreen

OpenGL Screensaver

QTCoreImage101

Vertex Optimization

**Declared In**

NSOpenGLView.h

**setOpenGLContext:**

Sets the NSOpenGLContext object associated with the receiver.

- (void)setOpenGLContext:(NSOpenGLContext \*)*context***Parameters***context*

The OpenGL context object to associate with the receiver.

**Discussion**

This method releases the current OpenGL context, if one already exists. You must also call the `setView:` method of the context object to synchronize the context with the view.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**- [clearGLContext](#) (page 7)- [openGLContext](#) (page 8)**Related Sample Code**

LiveVideoMixer2

**Declared In**

NSOpenGLView.h

**setPixelFormat:**

Sets the receiver's NSOpenGLPixelFormat object to the specified object.

- (void)setPixelFormat:(NSOpenGLPixelFormat \*)*pixelFormat***Parameters***pixelFormat*

The new pixel format object for the receiver.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**+ [defaultPixelFormat](#) (page 7)- [pixelFormat](#) (page 9)**Declared In**

NSOpenGLView.h

**update**

Called by Cocoa when the view's window moves or when the view itself moves or is resized.

- (void)update

**Discussion**

The default implementation simply calls the `update` method of `NSOpenGLContext`. You can override this method to perform additional update operations on the context or if you need to add locks for multithreaded access to multiple contexts.

**Availability**

Available in Mac OS X v10.0 and later.

**Related Sample Code**
