NSOpenPanel Class Reference

Inherits from	NSSavePanel : NSPanel : NSWindow : NSResponder : NSObject
Conforms to	NSUserInterfaceValidations (NSWindow) NSAnimatablePropertyContainer (NSWindow) NSCoding (NSResponder) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Declared in	NSOpenPanel.h
Companion guides	Application File Management Sheet Programming Topics for Cocoa
Related sample code	ExtractMovieAudioToAIFF LSMSmartCategorizer QTEExtractAndConvertToAIFF QTEExtractAndConvertToMovieFile QTKitMovieShuffler

Overview

The `NSOpenPanel` class provides the Open panel for the Cocoa user interface. Applications use the Open panel as a convenient way to query the user for the name of a file to open.

Tasks

Creating Panels

+ [openPanel](#) (page 7)

Creates and returns a [NSOpenPanel](#) (page 5) object.

Configuring Panels

- [canChooseFiles](#) (page 10)
Returns whether the receiver allows the user to choose files to open.
- [setCanChooseFiles:](#) (page 13)
Sets whether the user can select files in the receiver's browser.
- [canChooseDirectories](#) (page 10)
Returns whether the receiver allows the user to choose directories to open.
- [setCanChooseDirectories:](#) (page 13)
Sets whether the user can select directories in the receiver's browser.
- [resolvesAliases](#) (page 11)
Returns whether the receiver resolves aliases.
- [setResolvesAliases:](#) (page 14)
Sets whether the receiver resolves aliases to *resolvesAliases*.
- [allowsMultipleSelection](#) (page 7)
Returns whether the receiver's browser allows the user to open multiple files (and directories) at a time.
- [setAllowsMultipleSelection:](#) (page 12)
Sets whether the user can select multiple files (and directories) at one time for opening to *flag*.

Running Panels

- [beginForDirectory:file:types:modellessDelegate:didEndSelector:contextInfo:](#) (page 8)
Presents a modeless Open panel.
- [beginSheetForDirectory:file:types:modalForWindow:modalDelegate:didEndSelector:contextInfo:](#) (page 9)
Presents an Open panel as a sheet with the directory specified by *absoluteDirectoryPath* and optionally the file specified by *filename* selected.
- [runModalForDirectory:file:types:](#) (page 11)
Displays the receiver and begins a modal event loop that is terminated when the user clicks either OK or Cancel.
- [runModalForTypes:](#) (page 12)
Displays the receiver and begins a modal event loop that is terminated when the user clicks either OK or Cancel.

Accessing User Selection

- [filenames](#) (page 10)
Returns an array containing the absolute paths (as NSString objects) of the selected files and directories.
- [URLs](#) (page 14)
Returns an array containing the absolute paths of the selected files and directories as URLs.

Class Methods

openPanel

Creates and returns a [NSOpenPanel](#) (page 5) object.

```
+ (NSOpenPanel *)openPanel
```

Return Value

Initialized Open panel.

Discussion

The open panel has been initialized with default values.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSOpenPanel.h

Instance Methods

allowsMultipleSelection

Returns whether the receiver's browser allows the user to open multiple files (and directories) at a time.

```
- (BOOL)allowsMultipleSelection
```

Discussion

If multiple files or directories are allowed, then the `filename` method—inherited from `NSSavePanel`—returns a non-`nil` value only if one and only one file is selected. By contrast, `NSOpenPanel`'s [filenames](#) (page 10) method always returns the selected files, even if only one file is selected.

Availability

Available in Mac OS X v10.0 and later.

See Also

- [filename](#) (`NSSavePanel`)

- [filenames](#) (page 10)

- [setAllowsMultipleSelection:](#) (page 12)

Declared In

NSOpenPanel.h

beginForDirectory:file:types:modelessDelegate:didEndSelector:contextInfo:

Presents a modeless Open panel.

```
- (void)beginForDirectory:(NSString *)absoluteDirectoryPath file:(NSString *)filename
    types:(NSArray *)fileTypes modelessDelegate:(id)modelessDelegate
    didEndSelector:(SEL)didEndSelector contextInfo:(void *)contextInfo
```

Parameters*absoluteDirectoryPath*

Directory whose files the panel displays. When `nil`, the directory is the same directory used in the previous invocation of the panel; this is probably the best choice for most situations.

filename

Specifies a particular file in *absoluteDirectoryPath* that is selected when the Open panel is presented to the user. When `nil`, no file is initially selected.

fileTypes

Array of file extensions and/or HFS file types. Specifies the files the panel allows the user to select. `nil` makes all files in *absoluteDirectoryPath* selectable by the user. An array of types passed in here will override one set using `setAllowedFileTypes:`.

modelessDelegate

This is not the same as a delegate assigned to the panel. This delegate is temporary and the relationship only lasts until the panel is dismissed.

didEndSelector

Message sent to *modelessDelegate* after the panel's session has ended, but before dismissing the Open panel. *didEndSelector* may dismiss the Open panel itself; otherwise, it will be dismissed on return from the method. The corresponding method should have the following signature:

```
- (void)openPanelDidEnd:(NSOpenPanel *)panel returnCode:(int)returnCode
    contextInfo:(void *)contextInfo
```

The value passed as *returnCode* will be either `NSCancelButton` or `NSOKButton`.

contextInfo

Context information passed to *modelessDelegate* in the *didEndSelector* message.

Discussion

Similar to

[beginSheetForDirectory:file:types:modalForWindow:modalDelegate:didEndSelector:contextInfo:](#) (page 9), but allows for modeless operation of the panel.

Availability

Available in Mac OS X v10.3 and later.

Declared In

NSOpenPanel.h

beginSheetForDirectory:file:types:modalForWindow:modalDelegate:didEndSelector:contextInfo:

Presents an Open panel as a sheet with the directory specified by *absoluteDirectoryPath* and optionally the file specified by *filename* selected.

```
- (void)beginSheetForDirectory:(NSString *)absoluteDirectoryPath file:(NSString *)filename types:(NSArray *)fileTypes modalForWindow:(NSWindow *)docWindow modalDelegate:(id)modalDelegate didEndSelector:(SEL)didEndSelector contextInfo:(void *)contextInfo
```

Parameters

absoluteDirectoryPath

Directory whose files the panel displays. When *nil*, the directory is the same directory used in the previous invocation of the panel; this is probably the best choice for most situations.

filename

Specifies a particular file in *absoluteDirectoryPath* that is selected when the Open panel is presented to the user. When *nil*, no file is initially selected.

fileTypes

Array of file extensions and/or HFS file types. Specifies the files the panel allows the user to select. *nil* makes all files in *absoluteDirectoryPath* selectable by the user. An array of types passed in here will override one set using `setAllowedFileTypes:`.

docWindow

Window to open the sheet on.

modalDelegate

This is not the same as a delegate assigned to the panel. This delegate is temporary and the relationship only lasts until the panel is dismissed..

didEndSelector

Message sent to *modalDelegate* after the modal session has ended, but before dismissing the Open panel. *didEndSelector* may dismiss the Open panel itself; otherwise, it will be dismissed on return from the method. The corresponding method should have the following signature:

```
- (void)openPanelDidEnd:(NSOpenPanel *)panel returnCode:(int)returnCode contextInfo:(void *)contextInfo
```

The value passed as *returnCode* will be either `NSCancelButton` or `NSOKButton`.

contextInfo

Context information passed to *modalDelegate* in the *didEndSelector* message.

Availability

Available in Mac OS X v10.0 and later.

canChooseDirectories

Returns whether the receiver allows the user to choose directories to open.

- (BOOL)canChooseDirectories

Availability

Available in Mac OS X v10.0 and later.

See Also

- [setCanChooseDirectories:](#) (page 13)

Declared In

NSOpenPanel.h

canChooseFiles

Returns whether the receiver allows the user to choose files to open.

- (BOOL)canChooseFiles

Availability

Available in Mac OS X v10.0 and later.

See Also

- [setCanChooseFiles:](#) (page 13)

Declared In

NSOpenPanel.h

filenames

Returns an array containing the absolute paths (as NSString objects) of the selected files and directories.

- (NSArray *)filenames

Discussion

If multiple selections aren't allowed, the array contains a single name. The `filenames` method is preferable over `NSSavePanel's filename` to get the name or names of files and directories that the user has selected.

Availability

Available in Mac OS X v10.0 and later.

See Also

- [URLs](#) (page 14)

ThreadsImportMovie

Declared In

NSOpenPanel.h

resolvesAliases

Returns whether the receiver resolves aliases.

- (BOOL)resolvesAliases

Discussion

If YES, the effect is that dropping an alias on the receiver or asking for filenames or URLs returns the resolved aliases. The default is YES.

Availability

Available in Mac OS X v10.1 and later.

See Also- [setResolvesAliases:](#) (page 14)**Declared In**

NSOpenPanel.h

runModalForDirectory:file:types:

Displays the receiver and begins a modal event loop that is terminated when the user clicks either OK or Cancel.

- (NSInteger)runModalForDirectory:(NSString *)absoluteDirectoryPath file:(NSString *)filename types:(NSArray *)fileTypes

Parameters*absoluteDirectoryPath*Directory whose files the panel displays. When *nil*, the directory is the same directory used in the previous invocation of the panel; this is probably the best choice for most situations.*filename*Specifies a particular file in *absoluteDirectoryPath* that is selected when the Open panel is presented to the user. When *nil*, no file is initially selected.*fileTypes*Array of file extensions and/or HFS file types. Specifies the files the panel allows the user to select. *nil* makes all files in *absoluteDirectoryPath* selectable by the user. An array of types passed in here will override one set using `setAllowedFileTypes:`.**Return Value**Button clicked to dismiss the dialog: `NSOKButton` for the OK button and `NSCancelButton` for the Cancel button.**Discussion**You can control whether directories and files appear in the browser with the [setCanChooseDirectories:](#) (page 13) and [setCanChooseFiles:](#) (page 13) methods.**Availability**

Available in Mac OS X v10.0 and later.

Declared In

NSOpenPanel.h

runModalForTypes:

Displays the receiver and begins a modal event loop that is terminated when the user clicks either OK or Cancel.

```
- (NSInteger)runModalForTypes:(NSArray *)fileTypes
```

Parameters

fileTypes

Array of file extensions and/or HFS file types. Specifies the files the panel allows the user to select. *nil* makes all files selectable by the user. An array of types passed in here will override one set using `setAllowedFileTypes:`.

Return Value

Button used to dismiss the dialog: `NSOKButton` for the OK button and `NSCancelButton` for the Cancel button.

Discussion

This convenience method sends `runModalForDirectory:nil file:nil types:fileTypes` to the receiver. See [runModalForDirectory:file:types:](#) (page 11) for additional details.

Availability

Available in Mac OS X v10.0 and later.

Document Revision History

This table describes the changes to *NSOpenPanel Class Reference*.

Date	Notes
2009-02-04	Added more specific information regarding <code>didEndSelector</code> behavior in panel-running methods.
2007-04-03	Removed documentation for methods not present in the corresponding header file.
	Removed <code>allowedFileTypes</code> and <code>setAllowedFileTypes:</code> .
	Made editorial improvements.
2006-05-23	First publication of this content as a separate document.
