Declared in NSTextView.h.

**Declared In**

NSTextView.h

**NSFindPanelSubstringMatchType**

The type of substring matching used by the Find panel.

```
enum {
 NSFindPanelSubstringMatchTypeContains = 0,
 NSFindPanelSubstringMatchTypeStartsWith = 1,
 NSFindPanelSubstringMatchTypeFullWord = 2,
 NSFindPanelSubstringMatchTypeEndsWith = 3
};
typedef NSUInteger NSFindPanelSubstringMatchType;
```

**Constants**

NSFindPanelSubstringMatchTypeContains

Finds a word containing the search string.

Available in Mac OS X v10.5 and later.

Declared in NSTextView.h.

NSFindPanelSubstringMatchTypeStartsWith

Finds a word starting with the search string.

Available in Mac OS X v10.5 and later.

Declared in NSTextView.h.

`NSFindPanelSubstringMatchTypeFullWord`  
 Finds a word exactly matching the search string.  
 Available in Mac OS X v10.5 and later.  
 Declared in `NSTextView.h`.

`NSFindPanelSubstringMatchTypeEndsWith`  
 Finds a word ending with the search string.  
 Available in Mac OS X v10.5 and later.  
 Declared in `NSTextView.h`.

**Declared In**  
`NSTextView.h`

## Notifications

`NSTextView` posts the following notifications as well as those declared by its superclasses, particularly `NSText`. See the “Notifications” (page 2707) section in the `NSText` class specification for those other notifications.

### `NSTextViewDidChangeSelectionNotification`

Posted when the selected range of characters changes.

`NSTextView` posts this notification whenever `setSelectedRange:affinity:stillSelecting:` (page 2877) is invoked, either directly or through the many methods (`mouseDown:` (page 2133), `selectAll:` (page 2156), and so on) that invoke it indirectly. When the user is selecting text, this notification is posted only once, at the end of the selection operation. The text view's delegate receives a `textViewDidChangeSelection:` (page 2915) message when this notification is posted.

The notification object is the notifying text view. The `userInfo` dictionary contains the following information:

| Key                            | Value                                                                                                           |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------|
| @“NSOldSelectedCharacterRange” | An <code>NSValue</code> object containing an <code>NSRange</code> structure with the originally selected range. |

**Availability**  
 Available in Mac OS X v10.0 and later.

**Declared In**  
`NSTextView.h`

### `NSTextViewWillChangeNotifyingTextViewNotification`

Posted when a new text view is established as the text view that sends notifications.

This notification allows observers to reregister themselves for the new text view. Methods such as `removeTextContainerAtIndex:` (page 1471), `textContainerChangedTextView:` (page 1495), and `insertTextContainer:atIndex:` (page 1456) cause this notification to be posted.

The notification object is the old notifying text view, or `nil`. The `userInfo` dictionary contains the following information:

| Key                                     | Value                                                                         |
|-----------------------------------------|-------------------------------------------------------------------------------|
| @ <code>"NSOldNotifyingTextView"</code> | The old <code>NSTextView</code> , if one exists, otherwise <code>nil</code> . |
| @ <code>"NSNewNotifyingTextView"</code> | The new <code>NSTextView</code> , if one exists, otherwise <code>nil</code> . |

There's no delegate method associated with this notification. The text-handling system ensures that when a new text view replaces an old one as the notifying text view, the existing delegate becomes the delegate of the new text view, and the delegate is registered to receive text view notifications from the new notifying text view. All other observers are responsible for registering themselves on receiving this notification.

#### Availability

Available in Mac OS X v10.0 and later.

#### See Also

- `removeObserver:(NSNotificationCenter)`
- `addObserver:selector:name:object:(NSNotificationCenter)`

#### Declared In

`NSTextView.h`

### NSTextViewDidChangeTypingAttributesNotification

Posted when there is a change in the typing attributes within a text view. This notification is posted, via the `textViewDidChangeTypingAttributes:` (page 2915) delegate method, whether or not text has changed as a result of the attribute change.

#### Availability

Available in Mac OS X v10.3 and later.

#### Declared In

`NSTextView.h`

| <b>Availability</b>    | Available in Mac OS X v10.4 and later.                                                                                              |
| <b>Companion guide</b> | Token Field Programming Guide for Cocoa                                                                                             |

## Overview

`NSTextField` is a subclass of `NSTextField` that provides tokenized editing similar to the address field in the Mail application.

`NSTextField` uses an `NSTextFieldCell` to implement much of the control's functionality. `NSTextField` provides cover methods for most methods of `NSTextFieldCell`, which invoke the corresponding cell method.

**Notes:** In Mac OS X v10.4 and earlier, represented objects associated with token fields had to conform to `NSCoding`. Starting with Mac OS X v10.5, they no longer need to.

In Mac OS X v10.4, `NSTextField` trims whitespace around tokens but it does not trim whitespace in Mac OS X versions 10.5.0 and 10.5.1. In Mac OS X v10.5.2, you get whitespace-trimming behavior by either linking against the v10.4 binary or linking against the v10.5 binary and *not* implementing the `textField:representedObjectForEditingString:` (page 2930) method. If you do not want the whitespace-trimming behavior, link against the v10.5 binary and implement this method, returning the editing string if you have no represented object.

## Tasks

### Configuring the Token Style

- `setTokenStyle:` (page 2927)  
Returns the token style of the receiver.
- `tokenStyle` (page 2927)  
Returns the receiver's token style.

### Configuring the Tokenizing Character Set

- `setTokenizingCharacterSet:` (page 2927)  
Sets the receiver's tokenizing character set to *characterSet*.
- `tokenizingCharacterSet` (page 2927)  
Returns the receiver's tokenizing character set.
- + `defaultTokenizingCharacterSet` (page 2926)  
Returns the default tokenizing character set.

### Configuring the Completion Delay

- `setCompletionDelay:` (page 2926)  
Sets the receiver's completion delay.
- `completionDelay` (page 2926)  
Returns the receiver's completion delay.
- + `defaultCompletionDelay` (page 2925)  
Returns the default completion delay.

### Displaying a Tokenized String

- `textField:displayStringForRepresentedObject:` (page 2928) *delegate method*  
Allows the delegate to provide a string to be displayed as a proxy for the given represented object.

- `tokenField:styleForRepresentedObject:` (page 2931) *delegate method*  
Allows the delegate to return the token style for editing the specified represented object.

## Editing a Tokenized String

- `tokenField:completionsForSubstring:indexOfToken:indexOfSelectedItem:` (page 2928) *delegate method*  
Allows the delegate to provide an array of appropriate completions for the contents of the receiver.
- `tokenField:editingStringForRepresentedObject:` (page 2929) *delegate method*  
Allows the delegate to provide a string to be edited as a proxy for a represented object.
- `tokenField:representedObjectForEditingString:` (page 2930) *delegate method*  
Allows the delegate to provide a represented object for the given editing string.
- `tokenField:shouldAddObjects:atIndex:` (page 2931) *delegate method*  
Allows the delegate to validate the tokens to be added to the receiver at a particular location.

## Reading To and Writing From the Pasteboard

- `tokenField:readFromPasteboard:` (page 2930) *delegate method*  
Allows the delegate to return an array of objects representing the data read from the specified pasteboard.
- `tokenField:writeRepresentedObjects:toPasteboard:` (page 2932) *delegate method*  
Sent so the delegate can write represented objects to the pasteboard corresponding to a given array of display strings.

## Providing a Menu

- `tokenField:hasMenuForRepresentedObject:` (page 2929) *delegate method*  
Allows the delegate to specify whether the given represented object provides a menu.
- `tokenField:menuForRepresentedObject:` (page 2930) *delegate method*  
Allows the delegate to provide a menu for the specified represented object.

## Class Methods

### defaultCompletionDelay

Returns the default completion delay.

```
+ (NSTimeInterval)defaultCompletionDelay
```

#### Discussion

The default completion delay is 0.

#### Availability

Available in Mac OS X v10.4 and later.

**Declared In**

NSTextField.h

**defaultTokenizingCharacterSet**

Returns the default tokenizing character set.

```
+ (NSCharacterSet *)defaultTokenizingCharacterSet
```

**Discussion**

The default tokenizing character set is “,”.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

NSTextField.h

## Instance Methods

**completionDelay**

Returns the receiver's completion delay.

```
- (NSTimeInterval)completionDelay
```

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**[- setCompletionDelay:](#) (page 2926)[+ defaultCompletionDelay](#) (page 2925)**Declared In**

NSTextField.h

**setCompletionDelay:**

Sets the receiver's completion delay.

```
- (void)setCompletionDelay:(NSTimeInterval)delay
```

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**[- completionDelay](#) (page 2926)**Declared In**

NSTextField.h

## setTokenizingCharacterSet:

Sets the receiver's tokenizing character set to *characterSet*.

- (void)setTokenizingCharacterSet:(NSCharacterSet \*)*characterSet*

### Availability

Available in Mac OS X v10.4 and later.

### See Also

- [tokenizingCharacterSet](#) (page 2927)

### Declared In

NSTextField.h

## setTokenStyle:

Returns the token style of the receiver.

- (void)setTokenStyle:(NSTokenStyle)*style*

### Availability

Available in Mac OS X v10.4 and later.

### See Also

- [tokenStyle](#) (page 2927)

### Declared In

NSTextField.h

## tokenizingCharacterSet

Returns the receiver's tokenizing character set.

- (NSCharacterSet \*)tokenizingCharacterSet

### Availability

Available in Mac OS X v10.4 and later.

### See Also

- [setTokenizingCharacterSet:](#) (page 2927)

+ [defaultTokenizingCharacterSet](#) (page 2926)

### Declared In

NSTextField.h

## tokenStyle

Returns the receiver's token style.

- (NSTokenStyle)tokenStyle

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

– [setTokenStyle:](#) (page 2927)

**Declared In**

NSTextField.h

## Delegate Methods

### **tokenField:completionsForSubstring:indexOfToken:indexOfSelectedItem:**

Allows the delegate to provide an array of appropriate completions for the contents of the receiver.

```
- (NSArray *)tokenField:(NSTextField *)tokenField completionsForSubstring:(NSString *)substring indexOfToken:(NSInteger)tokenIndex indexOfSelectedItem:(NSInteger *)selectedIndex
```

**Parameters**

*tokenField*

The token field where editing is occurring.

*substring*

The partial string that is to be completed.

*tokenIndex*

The index of the token being edited.

*selectedIndex*

Optionally, you can return by-reference an index into the returned array that specifies which of the completions should be initially selected. If none are to be selected, return by reference -1.

**Return Value**

An array of possible completions.

**Discussion**

The default behavior of this method provides no completions.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

NSTextField.h

### **tokenField:displayStringForRepresentedObject:**

Allows the delegate to provide a string to be displayed as a proxy for the given represented object.

```
- (NSString *)tokenField:(NSTextField *)tokenField displayStringForRepresentedObject:(id)representedObject
```

**Parameters***tokenField*

The token field.

*representedObject*

A represented object of the token field.

**Return Value**

The string to be used as a proxy for *representedObject*. If you return `nil` or do not implement this method, then *representedObject* is displayed as the string.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**`NSTextField.h`**tokenField:editingStringForRepresentedObject:**

Allows the delegate to provide a string to be edited as a proxy for a represented object.

```
- (NSString *)tokenField:(NSTextField *)tokenField
 editingStringForRepresentedObject:(id)representedObject
```

**Discussion**

If you return `nil` from this method, the token field is not editable.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**`NSTextField.h`**tokenField:hasMenuForRepresentedObject:**

Allows the delegate to specify whether the given represented object provides a menu.

```
- (BOOL)tokenField:(NSTextField *)tokenField
 hasMenuForRepresentedObject:(id)representedObject
```

**Parameters***tokenField*

The token field.

*representedObject*

A represented object of the token field.

**Return Value**

YES if the represented object has a menu, NO otherwise.

**Discussion**

By default tokens have no menus.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

NSTextField.h

**tokenField:menuForRepresentedObject:**

Allows the delegate to provide a menu for the specified represented object.

```
- (NSMenu *)tokenField:(NSTextField *)tokenField
 menuForRepresentedObject:(id)representedObject
```

**Parameters***tokenField*

The token field.

*representedObject*

A represented object of the token field.

**Return Value**

The menu associated with the represented object.

**Discussion**

The returned menu should be autoreleased. By default tokens do not return menus.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

NSTextField.h

**tokenField:readFromPasteboard:**

Allows the delegate to return an array of objects representing the data read from the specified pasteboard.

```
- (NSArray *)tokenField:(NSTextField *)tokenField readFromPasteboard:(NSPasteboard
 *)pboard
```

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

NSTextField.h

**tokenField:representedObjectForEditingString:**

Allows the delegate to provide a represented object for the given editing string.

```
- (id)tokenField:(NSTextField *)tokenField
 representedObjectForEditingString:(NSString *)editingString
```

**Discussion**

If your application uses some object other than an `NSString` for their represented objects, you should return a new, autoreleased instance of that object from this method.

**Note:** In Mac OS X v10.4, `NSTextField` trims whitespace around tokens but it does not trim whitespace in Mac OS X versions 10.5.0 and 10.5.1. In Mac OS X v10.5.2, you get whitespace-trimming behavior by either linking against the v10.4 binary or linking against the v10.5 binary and *not* implementing the this method. If you do not want the whitespace-trimming behavior, link against the v10.5 binary and implement this method, returning the editing string if you have no represented object.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

`NSTextField.h`

**textField:shouldAddObjectsAtIndex:**

Allows the delegate to validate the tokens to be added to the receiver at a particular location.

```
- (NSArray *)textField:(NSTextField *)textField shouldAddObjects:(NSArray *)tokens
 atIndex:(NSUInteger) index
```

**Parameters**

*textField*

The token field being validated.

*tokens*

An array of tokens to be inserted in the receiver at *index*.

*index*

The index of the receiver in which the array of tokens to be validated (*tokens*) will be inserted.

**Return Value**

The array of tokens to be inserted.

**Discussion**

The delegate can return the array unchanged or return a modified array of tokens. To reject the add completely, return an empty array. Returning `nil` causes an error.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

`NSTextField.h`

**textField:styleForRepresentedObject:**

Allows the delegate to return the token style for editing the specified represented object.

```
- (NSTokenStyle)textField:(NSTextField *)textField
 styleForRepresentedObject:(id) representedObject
```

**Discussion**

The delegate should return `NSDefaultTokenStyle`, `NSPlainTextTokenStyle` or `NSRoundedTokenStyle`.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

NSTextField.h

**textField:writeRepresentedObjects:toPasteboard:**

Sent so the delegate can write represented objects to the pasteboard corresponding to a given array of display strings.

```
- (BOOL)textField:(NSTextField *)textField writeRepresentedObjects:(NSArray *)objects toPasteboard:(NSPasteboard *)pboard
```

**Parameters**

*textField*

The token field.

*objects*

An array of represented objects associated with the token field.

*pboard*

The pasteboard to which to write the represented objects.

**Return Value**

YES if the delegate writes the represented objects to the pasteboard, NO otherwise. If NO, the token field writes the display strings to the [NSStringPboardType](#) (page 1897) pasteboard.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

NSTextField.h

## Overview

`NSTextFieldCell` is a subclass of `NSTextFieldCell` that provides tokenized editing of an array of objects similar to the address field in the Mail application. The objects may be strings or objects that can be represented as strings. A single token field cell can be presented in an `NSTextField` control.

## Tasks

### Managing the Token Style

- [setTokenStyle:](#) (page 2937)  
Sets the token style of the receiver.
- [tokenStyle](#) (page 2938)  
Returns the receiver's token style.

### Managing the Tokenizing Character Set

- + [defaultTokenizingCharacterSet](#) (page 2935)  
Returns the default tokenizing character set.
- [setTokenizingCharacterSet:](#) (page 2937)  
Sets the receiver's tokenizing character set to a given character set.

- `tokenizingCharacterSet` (page 2938)  
Returns the receiver's tokenizing character set.

## Configuring the Completion Delay

- `setCompletionDelay:` (page 2936)  
Sets the receiver's completion delay to a given delay.
- `completionDelay` (page 2936)  
Returns the receiver's completion delay.
- + `defaultCompletionDelay` (page 2935)  
Returns the default completion delay.

## Managing the Delegate

- `delegate` (page 2936)  
Returns the receiver's delegate.
- `setDelegate:` (page 2937)  
Sets the receiver's delegate.

## Displaying Tokenized Strings

- `textFieldCell:displayStringForRepresentedObject:` (page 2939) *delegate method*  
Allows the delegate to provide a string to be displayed as a proxy for the represented object.
- `textFieldCell:styleForRepresentedObject:` (page 2942) *delegate method*  
Allows the delegate to return the token style for editing the specified represented object.

## Editing Tokenized Strings

- `textFieldCell:editingStringForRepresentedObject:` (page 2940) *delegate method*  
Allows the delegate to provide a string to be edited as a proxy for the represented object.
- `textFieldCell:completionsForSubstring:indexOfToken:indexOfSelectedItem:` (page 2939) *delegate method*  
Allows the delegate to provide an array of appropriate completions for the contents of the receiver.
- `textFieldCell:representedObjectForEditingString:` (page 2941) *delegate method*  
Allows the delegate to provide a represented object for the string being edited.
- `textFieldCell:shouldAddObjects:atIndex:` (page 2941) *delegate method*  
Allows the delegate to validate the tokens to be added to the receiver at a given index.

## Reading From and Writing to the Pasteboard

- `textFieldCell:readFromPasteboard:` (page 2940) *delegate method*  
Allows the delegate to return an array of objects representing the data read from *pboard*.

- `textFieldCell:writeRepresentedObjects:toPasteboard:` (page 2942) *delegate method*  
Allows the delegate the opportunity to write custom pasteboard types to the pasteboard for the represented objects in *objects*.

## Managing Menus for Represented Objects

- `textFieldCell:hasMenuForRepresentedObject:` (page 2940) *delegate method*  
Allows the delegate to specify whether the represented object provides a menu.
- `textFieldCell:menuForRepresentedObject:` (page 2940) *delegate method*  
Allows the delegate to provide a menu for the specified represented object.

## Class Methods

### defaultCompletionDelay

Returns the default completion delay.

```
+(NSTimeInterval)defaultCompletionDelay
```

#### Return Value

The default completion delay.

#### Discussion

The default completion delay is 0.

#### Availability

Available in Mac OS X v10.4 and later.

#### Declared In

`NSTextFieldCell.h`

### defaultTokenizingCharacterSet

Returns the default tokenizing character set.

```
+(NSCharacterSet *)defaultTokenizingCharacterSet
```

#### Return Value

The default tokenizing character set.

#### Discussion

The default tokenizing character set contains the single character “,”.

#### Availability

Available in Mac OS X v10.4 and later.

#### Declared In

`NSTextFieldCell.h`

## Instance Methods

### completionDelay

Returns the receiver's completion delay.

- (NSTimeInterval)completionDelay

#### Return Value

The receiver's completion delay.

#### Availability

Available in Mac OS X v10.4 and later.

#### See Also

- [setCompletionDelay:](#) (page 2936)  
+ [defaultCompletionDelay](#) (page 2935)

#### Declared In

NSTextFieldCell.h

### delegate

Returns the receiver's delegate.

- (id)delegate

#### Return Value

The receiver's delegate.

#### Availability

Available in Mac OS X v10.4 and later.

#### See Also

- [setDelegate:](#) (page 2937)

#### Declared In

NSTextFieldCell.h

### setCompletionDelay:

Sets the receiver's completion delay to a given delay.

- (void)setCompletionDelay:(NSTimeInterval)delay

#### Parameters

*delay*

The delay for the receiver.

#### Availability

Available in Mac OS X v10.4 and later.

**See Also**

- [completionDelay](#) (page 2936)

**Declared In**

NSTextFieldCell.h

**setDelegate:**

Sets the receiver's delegate.

- (void)setDelegate:(id)*anObject*

**Parameters**

*anObject*

The delegate for the receiver.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [delegate](#) (page 2936)

**Declared In**

NSTextFieldCell.h

**setTokenizingCharacterSet:**

Sets the receiver's tokenizing character set to a given character set.

- (void)setTokenizingCharacterSet:(NSCharacterSet \*)*characterSet*

**Parameters**

*characterSet*

The tokenizing character set for the receiver.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [tokenizingCharacterSet](#) (page 2938)

**Declared In**

NSTextFieldCell.h

**setTokenStyle:**

Sets the token style of the receiver.

- (void)setTokenStyle:(NSTokenStyle)*style*

**Parameters***style*

The token style for the receiver.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [tokenStyle](#) (page 2938)

**Declared In**

NSTextFieldCell.h

**tokenizingCharacterSet**

Returns the receiver's tokenizing character set.

- (NSCharacterSet \*)tokenizingCharacterSet

**Return Value**

The receiver's tokenizing character set.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [setTokenizingCharacterSet:](#) (page 2937)

+ [defaultTokenizingCharacterSet](#) (page 2935)

**Declared In**

NSTextFieldCell.h

**tokenStyle**

Returns the receiver's token style.

- (NSTokenStyle)tokenStyle

**Return Value**

The receiver's token style.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [setTokenStyle:](#) (page 2937)

**Declared In**

NSTextFieldCell.h

## Delegate Methods

### **tokenFieldCell:completionsForSubstring:indexOfToken:indexOfSelectedItem:**

Allows the delegate to provide an array of appropriate completions for the contents of the receiver.

```
- (NSArray *)tokenFieldCell:(NSTokenFieldCell *)tokenFieldCell
 completionsForSubstring:(NSString *)substring indexOfToken:(NSInteger)tokenIndex
 indexOfSelectedItem:(NSInteger *)selectedIndex
```

#### **Parameters**

*tokenFieldCell*

The token field cell sending the message to the delegate.

*substring*

The partial string that to be completed.

*tokenIndex*

The index of the token being edited.

*selectedIndex*

You may return by reference an index in the returned array that specifies which of the completions should be initially selected. If you do not want an initial selection, return `NULL`.

#### **Return Value**

An array of strings for completing *substring*.

#### **Discussion**

The default behavior provides no completions.

#### **Availability**

Available in Mac OS X v10.4 and later.

#### **Declared In**

`NSTokenFieldCell.h`

### **tokenFieldCell:displayStringForRepresentedObject:**

Allows the delegate to provide a string to be displayed as a proxy for the represented object.

```
- (NSString *)tokenFieldCell:(NSTokenFieldCell *)tokenFieldCell
 displayStringForRepresentedObject:(id)representedObject
```

#### **Discussion**

If you return `nil` or do not implement this method, then *representedObject* is displayed as the string.

#### **Availability**

Available in Mac OS X v10.4 and later.

#### **Declared In**

`NSTokenFieldCell.h`

**textFieldCell:editingStringForRepresentedObject:**

Allows the delegate to provide a string to be edited as a proxy for the represented object.

```
- (NSString *)textFieldCell:(NSTextFieldCell *)textFieldCell
 editingStringForRepresentedObject:(id)representedObject
```

**Discussion**

If you return `nil` or do not implement this method, then the value returned by `textFieldCell:displayStringForRepresentedObject:` (page 2939) is used for editing.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

`NSTextFieldCell.h`

**textFieldCell:hasMenuForRepresentedObject:**

Allows the delegate to specify whether the represented object provides a menu.

```
- (BOOL)textFieldCell:(NSTextFieldCell *)textFieldCell
 hasMenuForRepresentedObject:(id)representedObject
```

**Discussion**

By default tokens have no menus.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

`NSTextFieldCell.h`

**textFieldCell:menuForRepresentedObject:**

Allows the delegate to provide a menu for the specified represented object.

```
- (NSMenu *)textFieldCell:(NSTextFieldCell *)textFieldCell
 menuForRepresentedObject:(id)representedObject
```

**Discussion**

The returned menu should be autoreleased. By default tokens do not return menus.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

`NSTextFieldCell.h`

**textFieldCell:readFromPasteboard:**

Allows the delegate to return an array of objects representing the data read from *pboard*.

```
- (NSArray *)tokenFieldCell:(NSTextFieldCell *)tokenFieldCell
 readFromPasteboard:(NSPasteboard *)pboard
```

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

NSTextFieldCell.h

**tokenFieldCell:representedObjectForEditingString:**

Allows the delegate to provide a represented object for the string being edited.

```
- (id)tokenFieldCell:(NSTextFieldCell *)tokenFieldCell
 representedObjectForEditingString:(NSString *)editingString
```

**Parameters**

*tokenFieldCell*

The token field cell sending the message to the delegate.

*editingString*

The string being edited.

**Return Value**

A represented object associated with *editingString*.

**Discussion**

If your application uses some object other than an `NSString` object for their represented objects, you should return a new, autoreleased instance of that object from this method.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

NSTextFieldCell.h

**tokenFieldCell:shouldAddObjectsAtIndex:**

Allows the delegate to validate the tokens to be added to the receiver at a given index.

```
- (NSArray *)tokenFieldCell:(NSTextFieldCell *)tokenFieldCell
 shouldAddObjects:(NSArray *)tokens atIndex:(NSUInteger)index
```

**Parameters**

*tokenFieldCell*

The token field cell sending the message to the delegate.

*tokens*

An array of tokens to be added to the receiver.

*index*

The index in the receiver where the tokens are to be added.

**Return Value**

An array of validated tokens.

**Discussion**

The delegate can return the array unchanged or return a modified array of tokens. To reject the add completely, return an empty array. Returning `nil` causes an error.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

`NSTextFieldCell.h`

**textFieldCell:styleForRepresentedObject:**

Allows the delegate to return the token style for editing the specified represented object.

```
- (NSTokenStyle)textFieldCell:(NSTextFieldCell *)textFieldCell
 styleForRepresentedObject:(id)representedObject
```

**Discussion**

The delegate should return `NSDefaultTokenStyle`, `NSPlainTextTokenStyle` or `NSRoundedTokenStyle`.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

`NSTextFieldCell.h`

**textFieldCell:writeRepresentedObjects:toPasteboard:**

Allows the delegate the opportunity to write custom pasteboard types to the pasteboard for the represented objects in *objects*.

```
- (BOOL)textFieldCell:(NSTextFieldCell *)textFieldCell
 writeRepresentedObjects:(NSArray *)objects toPasteboard:(NSPasteboard *)pboard
```

**Discussion**

The display strings for the represented objects have already been placed on the pasteboard as both `NSStringPboardType` and an array of `NSString` objects.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

`NSTextFieldCell.h`

## Constants

**NSTokenStyle**

The `NSTokenStyle` type provides storage for values defined in “`NSTokenStyle` Values”.

```
typedef NSUInteger NSTokenStyle;
```

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

`NSTokenFieldCell.h`

## NSTokenStyle Values

The `NSTokenStyle` constants define how tokens are displayed and editable in the `NSTokenFieldCell`. These values are used by [tokenStyle](#) (page 2938), [setTokenStyle:](#) (page 2937) and the delegate method [tokenFieldCell:styleForRepresentedObject:](#) (page 2942).

```
enum {
 NSDefaultTokenStyle,
 NSPlainTextTokenStyle,
 NSRoundedTokenStyle
};
```

**Constants**

`NSDefaultTokenStyle`

Style best used for keyword type tokens.

Available in Mac OS X v10.4 and later.

Declared in `NSTokenFieldCell.h`.

`NSPlainTextTokenStyle`

Style to use for data you want represented as plain-text and without any token background.

Available in Mac OS X v10.4 and later.

Declared in `NSTokenFieldCell.h`.

`NSRoundedTokenStyle`

Style best used for address type tokens.

Available in Mac OS X v10.4 and later.

Declared in `NSTokenFieldCell.h`.

**Declared In**

`NSTokenFieldCell.h`

## Overview

`NSToolbar` and `NSToolbarItem` provide the mechanism for a titled window to display a toolbar just below its title bar, as shown below:

## Tasks

### Creating an NSToolbar Object

- [initWithIdentifier:](#) (page 2951)  
Initializes a newly allocated toolbar with the specified identifier.

### Toolbar Attributes

- [displayMode](#) (page 2950)  
Returns the receiver's display mode.
- [setDisplayMode:](#) (page 2956)  
Sets the receiver's display mode.
- [showsBaselineSeparator](#) (page 2958)  
Returns a Boolean value that indicates whether the toolbar shows the separator between the toolbar and the main window contents.
- [setShowsBaselineSeparator:](#) (page 2957)  
Sets whether the toolbar shows the separator between the toolbar and the main window contents.
- [allowsUserCustomization](#) (page 2948)  
Returns a Boolean value that indicates whether users are allowed to modify the toolbar.
- [setAllowsUserCustomization:](#) (page 2954)  
Sets whether users are allowed to modify the toolbar.
- [identifier](#) (page 2950)  
Returns the receiver's identifier.
- [items](#) (page 2952)  
Returns the receiver's current items, in order.
- [visibleItems](#) (page 2959)  
Returns the receiver's currently visible items.
- [sizeMode](#) (page 2959)  
Returns the receiver's size mode.
- [setSizeMode:](#) (page 2957)  
Sets the receiver's size mode.

### Managing the Delegate

- [delegate](#) (page 2950)  
Returns the receiver's delegate.
- [setDelegate:](#) (page 2955)  
Sets the receiver's delegate.

## Managing Items on the Toolbar

- `insertItemWithIdentifier:atIndex:` (page 2951)  
Inserts the specified item at the specified index.
- `removeItemAtIndex:` (page 2953)  
Removes the specified item.
- `toolbarWillAddItem:` (page 2963) *delegate method*  
Sent just before a new item is added to a toolbar.
- `toolbarDidRemoveItem:` (page 2962) *delegate method*  
Sent just after an item has been removed from a toolbar.
- `setSelectedItemIdentifier:` (page 2956)  
Sets the receiver's selected item to the specified toolbar item.
- `selectedItemIdentifier` (page 2953)  
Returns the identifier of the receiver's currently selected item, or `nil` if there is no selection.

## Displaying the Toolbar

- `isVisible` (page 2952)  
Returns a Boolean value that indicates whether the receiver is visible.
- `setVisible:` (page 2958)  
Sets whether the receiver is visible or hidden.

## Toolbar Customization

- `runCustomizationPalette:` (page 2953)  
Runs the receiver's customization palette.
- `customizationPaletteIsRunning` (page 2949)  
Returns a Boolean value that indicates whether the receiver's customization palette is running (in use).

## Autosaving the Configuration

- `autosavesConfiguration` (page 2948)  
Returns a Boolean value that indicates whether the receiver autosaves its configuration.
- `setAutosavesConfiguration:` (page 2954)  
Sets whether the receiver autosaves its configuration.
- `configurationDictionary` (page 2949)  
Returns the receiver's configuration as a dictionary.
- `setConfigurationFromDictionary:` (page 2955)  
Sets the receiver's configuration using `configDict`.

## Working With Item Identifiers

- [toolbar:itemForItemIdentifier:willBeInsertedIntoToolbar:](#) (page 2960) *delegate method*  
Sent to request a new toolbar item; returns a toolbar item of the identified kind for the specified toolbar.
- [toolbarAllowedItemIdentifiers:](#) (page 2961) *delegate method*  
Sent to discover the allowed item identifiers for a toolbar.
- [toolbarDefaultItemIdentifiers:](#) (page 2961) *delegate method*  
Sent to discover the default item identifiers for a toolbar.
- [toolbarSelectableItemIdentifiers:](#) (page 2962) *delegate method*  
Sent to discover the selectable item identifiers for a toolbar.
- [validateVisibleItems](#) (page 2959)  
Called on window updates to validate the visible items.

## Instance Methods

### allowsUserCustomization

Returns a Boolean value that indicates whether users are allowed to modify the toolbar.

- (BOOL)allowsUserCustomization

#### Return Value

YES if users are allowed to modify the toolbar, NO otherwise. The default is NO.

#### Discussion

If the value is NO, then the Customize Toolbar... menu item is disabled and other modification is disabled. This attribute does not affect the user's ability to show or hide the toolbar.

#### Availability

Available in Mac OS X v10.0 and later.

#### See Also

- [setAllowsUserCustomization:](#) (page 2954)
- [autosavesConfiguration](#) (page 2948)

#### Declared In

NSToolbar.h

### autosavesConfiguration

Returns a Boolean value that indicates whether the receiver autosaves its configuration.

- (BOOL)autosavesConfiguration

#### Return Value

YES if the receiver autosaves its configuration, otherwise NO. The default is NO.

**Discussion**

When autosaving is enabled, the receiver will automatically write the toolbar settings to user defaults if the toolbar configuration changes. The toolbar's configuration is identified in user defaults by the toolbar identifier. If there are multiple toolbars active with the same identifier, they all share the same configuration.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setAutosavesConfiguration:](#) (page 2954)
- [configurationDictionary](#) (page 2949)

**Declared In**

NSToolbar.h

## configurationDictionary

Returns the receiver's configuration as a dictionary.

- (NSDictionary \*)configurationDictionary

**Return Value**

A dictionary containing configuration information for the toolbar.

**Discussion**

Contains `displayMode`, `isVisible`, and a list of the item identifiers currently in the toolbar.

**Special Considerations**

Do not depend on any details of the normal contents of a configuration dictionary.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setConfigurationFromDictionary:](#) (page 2955)

**Declared In**

NSToolbar.h

## customizationPalettelsRunning

Returns a Boolean value that indicates whether the receiver's customization palette is running (in use).

- (BOOL)customizationPaletteIsRunning

**Return Value**

YES if the receiver's customization palette is running, otherwise NO.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [runCustomizationPalette:](#) (page 2953)

**Declared In**  
NSToolbar.h

## delegate

Returns the receiver's delegate.

- (id)delegate

**Return Value**  
The receiver's delegate.

**Discussion**  
Every toolbar must have a delegate, which must implement the required delegate methods.

**Availability**  
Available in Mac OS X v10.0 and later.

**See Also**  
- [setDelegate:](#) (page 2955)

**Declared In**  
NSToolbar.h

## displayMode

Returns the receiver's display mode.

- (NSToolbarDisplayMode)displayMode

**Return Value**  
The receiver's display mode.

**Availability**  
Available in Mac OS X v10.0 and later.

**See Also**  
- [setDisplayMode:](#) (page 2956)

**Declared In**  
NSToolbar.h

## identifier

Returns the receiver's identifier.

- (NSString \*)identifier

**Return Value**  
The receiver's identifier, a string used by the class to identify the kind of toolbar.

**Discussion**

Within the application all toolbars with the same identifier are synchronized to maintain the same state, including for example, the display mode and item order. The identifier is used as the autosave name for toolbars that save their configuration.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- `setAutosavesConfiguration:`

**Declared In**

`NSToolbar.h`

**initWithIdentifier:**

Initializes a newly allocated toolbar with the specified identifier.

```
- (id)initWithIdentifier:(NSString *)identifier
```

**Parameters**

*identifier*

A string used by the class to identify the kind of the toolbar.

**Return Value**

The initialized toolbar object.

**Discussion**

*identifier* is never seen by users and should not be localized. See [identifier](#) (page 2950) for important information.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [identifier](#) (page 2950)

**Declared In**

`NSToolbar.h`

**insertItemWithIdentifier:atIndex:**

Inserts the specified item at the specified index.

```
- (void)insertItemWithIdentifier:(NSString *)itemIdentifier
 atIndex:(NSInteger)index
```

**Parameters**

*itemIdentifier*

The identifier of the item to insert.

*index*

The index at which to insert the item.

**Discussion**

If the toolbar needs a new instance, it will get it from

[toolbar:itemForItemIdentifier:willBeInsertedIntoToolbar:](#) (page 2960). Typically, you should not call this method; you should let the user reconfigure the toolbar. See [identifier](#) (page 2950) for important information.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [removeItemAtIndex:](#) (page 2953)

**Declared In**

NSToolbar.h

**isVisible**

Returns a Boolean value that indicates whether the receiver is visible.

- (BOOL)isVisible

**Return Value**

YES if the receiver is visible, otherwise NO.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setVisible:](#) (page 2958)

**Declared In**

NSToolbar.h

**items**

Returns the receiver's current items, in order.

- (NSArray \*)items

**Return Value**

An array of the items in the toolbar.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [visibleItems](#) (page 2959)

**Declared In**

NSToolbar.h

## removeItemAtIndex:

Removes the specified item.

```
- (void)removeItemAtIndex:(NSInteger) index
```

### Parameters

*index*

The index of the item to remove.

### Discussion

Typically, you should not call this method; you should let the user reconfigure the toolbar. See [identifier](#) (page 2950) for important information.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [insertItemWithIdentifier:atIndex:](#) (page 2951)

### Declared In

NSToolbar.h

## runCustomizationPalette:

Runs the receiver's customization palette.

```
- (void)runCustomizationPalette:(id) sender
```

### Parameters

*sender*

The control sending the message.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [customizationPaletteIsRunning](#) (page 2949)

### Declared In

NSToolbar.h

## selectedItemIdentifier

Returns the identifier of the receiver's currently selected item, or `nil` if there is no selection.

```
- (NSString *)selectedItemIdentifier
```

### Return Value

The identifier of the receiver's currently selected item, or `nil` if there is no selection.

### Availability

Available in Mac OS X v10.3 and later.

**See Also**

- [setSelectedItemIdentifier:](#) (page 2956)

**Declared In**

NSToolbar.h

**setAllowsUserCustomization:**

Sets whether users are allowed to modify the toolbar.

- (void)setAllowsUserCustomization:(BOOL)*allowsCustomization*

**Parameters**

*allowsCustomization*

YES to allow users to modify the toolbar, NO otherwise.

**Discussion**

This value can be changed at any time. For instance, you may not want users to be able to customize the toolbar while some event is being processed. This attribute does not affect the user's ability to show or hide the toolbar.

If you set the toolbar to allow customization, be sure to also set the toolbar to autosave its configuration so the user's changes persist.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [allowsUserCustomization](#) (page 2948)  
- [setAutosavesConfiguration:](#) (page 2954)

**Related Sample Code**

EnhancedDataBurn

iSpend

PDFKitLinker2

Quartz Composer QCTV

ToolbarSample

**Declared In**

NSToolbar.h

**setAutosavesConfiguration:**

Sets whether the receiver autosaves its configuration.

- (void)setAutosavesConfiguration:(BOOL)*flag*

**Parameters**

*flag*

YES to indicate that the receiver should autosave its configuration, NO otherwise.

**Discussion**

Customizable toolbars should generally supporting autosaving. If you need to customize the saving behavior, you can use the [configurationDictionary](#) (page 2949) to access the settings that should be saved.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [allowsUserCustomization](#) (page 2948)
- [autosavesConfiguration](#) (page 2948)

**Related Sample Code**

EnhancedDataBurn

iSpend

PDFKitLinker2

ToolbarSample

**Declared In**

NSToolbar.h

**setConfigurationFromDictionary:**

Sets the receiver's configuration using *configDict*.

- (void)setConfigurationFromDictionary:(NSDictionary \*)*configDict*

**Parameters**

*configDict*

A dictionary with the toolbar's configuration information. If you want to provide a custom dictionary, you should first get the receiver's current configuration dictionary, then create a modified copy, rather than trying to construct one yourself.

**Discussion**

This method immediately affects toolbars with the same identifier in all windows of your application.

**Special Considerations**

Do not depend on any details of the normal contents of a configuration dictionary.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [configurationDictionary](#) (page 2949)

**Declared In**

NSToolbar.h

**setDelegate:**

Sets the receiver's delegate.

- (void)setDelegate:(id)*delegate*

**Parameters***delegate*

The new delegate object.

**Discussion**

Every toolbar must have a delegate, which must implement the required delegate methods.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [delegate](#) (page 2950)

Quartz Composer QCTV

ToolbarSample

**Declared In**

NSToolbar.h

**setSelectedItemIdentifier:**

Sets the receiver's selected item to the specified toolbar item.

```
- (void)setSelectedItemIdentifier:(NSString *)itemIdentifier
```

**Parameters**

*itemIdentifier*

The identifier of the item to select. *itemIdentifier* may be any identifier returned by `toolbarSelectableItemIdentifiers:`, even if it is not currently in the toolbar.

**Discussion**

Typically, a toolbar will manage the selection of items automatically. This method can be used to select identifiers of custom view items, or to force a selection change. See [toolbarSelectableItemIdentifiers:](#) (page 2962) for more details. If *itemIdentifier* is not recognized by the receiver, the current selected item identifier does not change.

**Availability**

Available in Mac OS X v10.3 and later.

**See Also**

- [selectedItemIdentifier](#) (page 2953)
- [toolbarSelectableItemIdentifiers:](#) (page 2962)

**Declared In**

NSToolbar.h

**setShowsBaselineSeparator:**

Sets whether the toolbar shows the separator between the toolbar and the main window contents.

```
- (void)setShowsBaselineSeparator:(BOOL) flag
```

**Parameters**

*flag*

YES if the toolbar should show the separator between the toolbar and the main window contents, otherwise NO.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [showsBaselineSeparator](#) (page 2958)

**Declared In**

NSToolbar.h

**setSizeMode:**

Sets the receiver's size mode.

```
- (void)setSizeMode:(NSToolbarSizeMode) sizeMode
```

**Parameters**

*sizeMode*

The new size mode.

**Discussion**

If there is no icon of the given size for a toolbar item, the toolbar item creates one by scaling an icon of another size.

**Availability**

Available in Mac OS X v10.2 and later.

**See Also**

– [sizeMode](#) (page 2959)

**Declared In**

NSToolbar.h

**setVisible:**

Sets whether the receiver is visible or hidden.

– (void)setVisible:(BOOL)shown

**Parameters**

*shown*

YES to indicate the receiver should be made visible, NO to indicate it should be hidden.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [isVisible](#) (page 2952)

**Declared In**

NSToolbar.h

**showsBaselineSeparator**

Returns a Boolean value that indicates whether the toolbar shows the separator between the toolbar and the main window contents.

– (BOOL)showsBaselineSeparator

**Return Value**

YES if the toolbar shows the separator between the toolbar and the main window contents, otherwise NO. The default is YES.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

– [setShowsBaselineSeparator:](#) (page 2957)

**Declared In**

NSToolbar.h

## sizeMode

Returns the receiver's size mode.

- (NSToolbarSizeMode)sizeMode

### Return Value

The receiver's size mode.

### Availability

Available in Mac OS X v10.2 and later.

### See Also

- [setSizeMode:](#) (page 2957)

### Declared In

NSToolbar.h

## validateVisibleItems

Called on window updates to validate the visible items.

- (void)validateVisibleItems

### Discussion

You typically use this method by overriding it in a subclass. The default implementation of this method iterates through the list of visible items, sending each a `validate` message. Override it and call `super` if you want to know when this method is called.

This method forces a validation of the entire visible set of items, so typically you should not invoke it directly. Instead, if necessary you should validate on a per item basis only those items that have auto-validation disabled (see [validate](#) (page 2984) and Validating Toolbar Items)—you generally do this for performance reasons if your validation code is slow.

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

NSToolbar.h

## visibleItems

Returns the receiver's currently visible items.

- (NSArray \*)visibleItems

### Return Value

An array of the toolbar's visible items.

### Discussion

Items in the overflow menu are not considered visible.

### Availability

Available in Mac OS X v10.0 and later.

**See Also**

- [items](#) (page 2952)

**Declared In**

NSToolbar.h

## Delegate Methods

### toolbar:itemForItemIdentifier:willBeInsertedIntoToolbar:

Sent to request a new toolbar item; returns a toolbar item of the identified kind for the specified toolbar.

```
- (NSToolbarItem *)toolbar:(NSToolbar *)toolbar itemForItemIdentifier:(NSString *)itemIdentifier willBeInsertedIntoToolbar:(BOOL)flag
```

**Parameters**

*toolbar*

The toolbar for which the item is being requested.

*itemIdentifier*

The identifier for the requested item.

*flag*

YES if the item will be immediately inserted into the toolbar. If *flag* is NO the toolbar item is being requested for display in the toolbar customization sheet and should always be enabled or provide some other canonical representation. If you ignore this parameter the same toolbar item will be used in the toolbar and in the customization sheet.

**Return Value**

The toolbar item for the specified toolbar and identifier. Return `nil` to indicate that the identified kind of toolbar item is not supported. When an item is requested again, you may return the same `NSToolbarItem` object returned earlier or a different instance.

**Discussion**

Implement this method to create new toolbar item instances. This method is called lazily on behalf of a toolbar instance, which must be the sole owner of the toolbar item. A toolbar may ask again for a kind of toolbar item already supplied to it, in which case this method may return the same toolbar item it returned before or a different one. If your delegate services multiple toolbars, each attached to a different window, it is best to return a different item for each toolbar—an `NSToolbarItem` object can only be in one toolbar at a time.

If the item is a custom view item, the `NSView` object must be fully formed when the item is returned. Do not assume that the returned item is going to be added as an active item in the toolbar, as it could be that it will be used only in the customization palette. (The customization palette makes a copy of the returned item.)

Implementation of this method is required.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSToolbar.h

## toolbarAllowedItemIdentifiers:

Sent to discover the allowed item identifiers for a toolbar.

```
- (NSArray *)toolbarAllowedItemIdentifiers:(NSToolbar *)toolbar
```

### Parameters

*toolbar*

The toolbar whose allowed item identifiers are to be returned.

### Return Value

An array of toolbar item identifiers for *toolbar*, specifying the contents and the order of the items in the configuration palette.

### Discussion

Every allowed item must be explicitly listed, even the standard ones. The identifiers returned should include all of those returned by `toolbarDefaultItemIdentifiers:`.

Implementation of this method is required.

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

NSToolbar.h

## toolbarDefaultItemIdentifiers:

Sent to discover the default item identifiers for a toolbar.

```
- (NSArray *)toolbarDefaultItemIdentifiers:(NSToolbar *)toolbar
```

### Parameters

*toolbar*

The toolbar whose default item identifiers are to be returned.

### Return Value

An array of toolbar item identifiers for *toolbar*, specifying the contents and the order of the items in the default toolbar configuration.

### Discussion

During initialization of *toolbar*, this method is called only if a toolbar configuration for the identifier of *toolbar* is not found in the user preferences. This method is called during initialization of the toolbar customization palette.

Implementation of this method is required.

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

NSToolbar.h

## toolbarDidRemoveItem:

Sent just after an item has been removed from a toolbar.

```
- (void)toolbarDidRemoveItem:(NSNotification *)notification
```

### Parameters

*notification*

The notification object sent to observers of [NSToolbarDidRemoveItemNotification](#) (page 2964).

### Discussion

This method allows you to remove information related to the item that may have been cached.

Implementation of this method is optional.

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

NSToolbar.h

## toolbarSelectableItemIdentifiers:

Sent to discover the selectable item identifiers for a toolbar.

```
- (NSArray *)toolbarSelectableItemIdentifiers:(NSToolbar *)toolbar
```

### Parameters

*toolbar*

The toolbar whose selectable item identifiers are to be returned.

### Return Value

An array of item identifiers that should indicate selection in the specified *toolbar*.

### Discussion

Toolbars that need to indicate item selection should return an array containing the identifiers of the selectable toolbar items.

If implemented, *toolbar* will display the currently selected item with a visual highlight. Clicking on an item whose identifier is selectable will automatically update the toolbar's selected item identifier, when possible. Clicking an item whose identifier is not selectable will not update the toolbar's selected item identifier.

Implementation of this method is optional.

### Availability

Available in Mac OS X v10.3 and later.

### See Also

- [setSelectedItemIdentifier:](#) (page 2956)

### Declared In

NSToolbar.h

**toolbarWillAddItem:**

Sent just before a new item is added to a toolbar.

```
- (void)toolbarWillAddItem:(NSNotification *)notification
```

**Parameters**

*notification*

The notification object sent to observers of [NSToolbarWillAddItemNotification](#) (page 2965).

**Discussion**

If you need to cache a reference to a toolbar item or need to set up some initial state before a toolbar item is added, this is where to do it.

Implementation of this method is optional.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSToolbar.h

## Constants

**NSToolbarDisplayMode**

These constants specify toolbar display modes and are used by [displayMode](#) (page 2950) and [setDisplayMode:](#) (page 2956).

```
typedef enum {
 NSToolbarDisplayModeDefault,
 NSToolbarDisplayModeIconAndLabel,
 NSToolbarDisplayModeIconOnly,
 NSToolbarDisplayModeLabelOnly
} NSToolbarDisplayMode;
```

**Constants**

NSToolbarDisplayModeDefault

The default display mode.

Available in Mac OS X v10.0 and later.

Declared in NSToolbar.h.

NSToolbarDisplayModeIconAndLabel

The toolbar will display icons and labels.

Available in Mac OS X v10.0 and later.

Declared in NSToolbar.h.

NSToolbarDisplayModeIconOnly

The toolbar will display only icons.

Available in Mac OS X v10.0 and later.

Declared in NSToolbar.h.

`NSToolbarDisplayModeLabelOnly`

The toolbar will display only labels.

Available in Mac OS X v10.0 and later.

Declared in `NSToolbar.h`.

#### Availability

Available in Mac OS X v10.0 and later.

#### Declared In

`NSToolbar.h`

## NSToolbarSizeMode

These constants specify toolbar display modes and are used by `sizeMode` (page 2959) and `setSizeMode:` (page 2957).

```
typedef enum {
 NSToolbarSizeModeDefault,
 NSToolbarSizeModeRegular,
 NSToolbarSizeModeSmall
} NSToolbarSizeMode;
```

#### Constants

`NSToolbarSizeModeDefault`

The toolbar uses the system-defined default size, which is `NSToolbarSizeModeRegular`.

Available in Mac OS X v10.2 and later.

Declared in `NSToolbar.h`.

`NSToolbarSizeModeRegular`

The toolbar uses regular-sized controls and 32 by 32 pixel icons.

Available in Mac OS X v10.2 and later.

Declared in `NSToolbar.h`.

`NSToolbarSizeModeSmall`

The toolbar uses small-sized controls and 24 by 24 pixel icons.

Available in Mac OS X v10.2 and later.

Declared in `NSToolbar.h`.

#### Availability

Available in Mac OS X v10.2 and later.

#### Declared In

`NSToolbar.h`

## Notifications

### NSToolbarDidRemoveItemNotification

Posted after an item is removed from a toolbar. The notification item is the `NSToolbar` object that had an item removed from it. The `userInfo` dictionary contains the following information:

| Key     | Value                                                   |
|---------|---------------------------------------------------------|
| @"item" | The <code>NSToolbarItem</code> object that was removed. |

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [toolbarDidRemoveItem:](#) (page 2962)

**Declared In**

`NSToolbar.h`

**NSToolbarWillAddItemNotification**

Posted before a new item is added to the toolbar. The notification item is the `NSToolbar` object having an item added to it. The *userInfo* dictionary contains the following information:

| Key     | Value                                              |
|---------|----------------------------------------------------|
| @"item" | The <code>NSToolbarItem</code> object being added. |

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [toolbarWillAddItem:](#) (page 2963)

**Declared In**

`NSToolbar.h`

## Overview

Each item in an NSToolbar is an instance of NSToolbarItem.

## Adopted Protocols

### NSCopying

- copyWithZone:

### NSValidatedUserInterfaceItem

- [action](#) (page 3637)
- [tag](#) (page 3638)

## Tasks

### Creating a Toolbar Item

- `initWithItemIdentifier:` (page 2971)  
Initialize the receiver with a given identifier.

### Managing Attributes

- `itemIdentifier` (page 2972)  
Returns the receiver's identifier.
- `toolbar` (page 2983)  
Returns the toolbar that is using the receiver.
- `label` (page 2973)  
Returns the receiver's label.
- `setLabel:` (page 2977)  
Sets the receiver's label that appears in the toolbar.
- `paletteLabel` (page 2974)  
Returns the label that appears when the receiver is in the customization palette.
- `setPaletteLabel:` (page 2979)  
Sets the receiver's label that appears when it is in the customization palette.
- `toolTip` (page 2983)  
Returns the tooltip used when the receiver is displayed in the toolbar.
- `setToolTip:` (page 2981)  
Sets the tooltip to be used when the receiver is displayed in the toolbar.
- `menuFormRepresentation` (page 2974)  
Returns the receiver's menu form representation.
- `setMenuFormRepresentation:` (page 2978)  
Sets the receiver's menu form.
- `tag` (page 2982)  
Returns the receiver's tag.
- `setTag:` (page 2980)  
Sets the receiver's tag.
- `target` (page 2983)  
Returns the receiver's target.
- `setTarget:` (page 2980)  
Sets the receiver's target.
- `action` (page 2970)  
Returns the receiver's action.
- `setAction:` (page 2975)  
Sets the receiver's action.

- `isEnabled` (page 2972)  
Returns a Boolean value that indicates whether the receiver is enabled.
- `setEnabled:` (page 2976)  
Sets the receiver's enabled flag.
- `image` (page 2971)  
Returns the image of the receiver.
- `setImage:` (page 2976)  
Sets the image for the receiver or of the view.
- `view` (page 2984)  
Returns the receiver's view.
- `setView:` (page 2981)  
Use this method to make the receiver into a view item.
- `minSize` (page 2974)  
Returns the receiver's minimum size.
- `setMinSize:` (page 2979)  
Sets the receiver's minimum size to a given size.
- `maxSize` (page 2973)  
Returns the receiver's maximum size.
- `setMaxSize:` (page 2978)  
Sets the receiver's maximum size to a given size.

## Visibility Priority

- `visibilityPriority` (page 2985)  
Returns the receiver's visibility priority.
- `setVisibilityPriority:` (page 2982)  
Sets the receiver's visibility priority.

## Validation

- `validate` (page 2984)  
This method is called by the receiver's toolbar during validation.
- `autovalidates` (page 2970)  
Returns a Boolean value that indicates whether the receiver is automatically validated by the toolbar.
- `setAutovalidates:` (page 2976)  
Sets the receiver's auto validation flag.

## Controlling Duplicates

- `allowsDuplicatesInToolbar` (page 2970)  
Returns a Boolean value that indicates whether the receiver can be represented in the toolbar at more than one position.

## Instance Methods

### **action**

Returns the receiver's action.

- (SEL)action

#### **Return Value**

The receiver's action.

#### **Discussion**

For custom view items, this method sends `action` to the view if it responds and returns the result.

#### **Availability**

Available in Mac OS X v10.0 and later.

#### **See Also**

- [setAction:](#) (page 2975)

#### **Related Sample Code**

EnhancedDataBurn

ToolbarSample

#### **Declared In**

NSToolbarItem.h

### **allowsDuplicatesInToolbar**

Returns a Boolean value that indicates whether the receiver can be represented in the toolbar at more than one position.

- (BOOL)allowsDuplicatesInToolbar

#### **Return Value**

YES to allow dragging the receiver into the toolbar at more than one position, otherwise NO.

#### **Discussion**

You use this method by overriding it in a subclass to always return YES; typically, you wouldn't call it. By default, if an item with the same identifier is already in the toolbar, dragging it in again will effectively move it to the new position.

#### **Availability**

Available in Mac OS X v10.0 and later.

#### **Declared In**

NSToolbarItem.h

### **autovalidates**

Returns a Boolean value that indicates whether the receiver is automatically validated by the toolbar.

- (BOOL)autovalidates

**Return Value**

YES if the receiver is automatically validated by the toolbar, otherwise NO.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [setAutovalidates:](#) (page 2976)

**Declared In**

NSToolbarItem.h

## image

Returns the image of the receiver.

- (NSImage \*)image

**Return Value**

The image of the receiver.

**Discussion**

For an image item this method returns the result of the most recent [setImage:](#) (page 2976). For view items, this method calls `image` on the view if it responds and returns the result.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setImage:](#) (page 2976)

**Related Sample Code**

ToolbarSample

**Declared In**

NSToolbarItem.h

## initWithItemIdentifier:

Initialize the receiver with a given identifier.

- (id)initWithItemIdentifier:(NSString \*)*itemIdentifier*

**Parameters**

*itemIdentifier*

The identifier for the receiver. *itemIdentifier* is never seen by users and should not be localized.

**Discussion**

The identifier is used by the toolbar and its delegate to identify the kind of the toolbar item.

**Availability**

Available in Mac OS X v10.0 and later.

**Related Sample Code**

GridCalendar

iSpend

PDFKitLinker2

Quartz Composer QCTV

ToolbarSample

**Declared In**

NSToolbarItem.h

**isEnabled**

Returns a Boolean value that indicates whether the receiver is enabled.

- (BOOL)isEnabled

**Return Value**

YES if the receiver is enabled, otherwise NO.

**Discussion**

For a view item, this method calls `isEnabled` on the view if it responds and returns the result.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setEnabled:](#) (page 2976)

- [view](#) (page 2984)

**Declared In**

NSToolbarItem.h

**itemIdentifier**

Returns the receiver's identifier.

- (NSString \*)itemIdentifier

**Return Value**

The receiver's identifier, which was provided in the initializer.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [initWithItemIdentifier:](#) (page 2971)

**Declared In**

NSToolbarItem.h

## label

Returns the receiver's label.

- (NSString \*)label

### Return Value

The receiver's label, which normally appears in the toolbar and in the overflow menu.

### Discussion

For a discussion on labels, see “Setting a Toolbar Item's Representation”.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [setLabel:](#) (page 2977)
- [menuFormRepresentation](#) (page 2974)

### Related Sample Code

PDFKitLinker2

Quartz Composer QCTV

ToolbarSample

### Declared In

NSToolbarItem.h

## maxSize

Returns the receiver's maximum size.

- (NSSize)maxSize

### Return Value

The receiver's maximum size.

### Discussion

See “Setting a Toolbar Item's Size” for a discussion on item sizes.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [setMaxSize:](#) (page 2978)

### Related Sample Code

Quartz Composer QCTV

### Declared In

NSToolbarItem.h

## menuFormRepresentation

Returns the receiver's menu form representation.

- (NSMenuItem \*)menuFormRepresentation

### Return Value

The receiver's menu form representation.

### Discussion

By default, this method returns `nil`, even though there is a default menu form representation.

For a discussion on menu forms, see “Setting a Toolbar Item's Representation”.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [setMenuFormRepresentation:](#) (page 2978)

### Related Sample Code

ToolbarSample

### Declared In

NSToolbarItem.h

## minSize

Returns the receiver's minimum size.

- (NSSize)minSize

### Return Value

The receiver's minimum size.

### Discussion

See “Setting a Toolbar Item's Size” for a discussion on item sizes.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [setMinSize:](#) (page 2979)

### Declared In

NSToolbarItem.h

## paletteLabel

Returns the label that appears when the receiver is in the customization palette.

- (NSString \*)paletteLabel

**Return Value**

The label that appears when the receiver is in the customization palette.

**Discussion**

An item must have a palette label if the customization palette is to be used, and for most items it is reasonable to set `paletteLabel` to be the same value as `label` (page 2973). One reason for `paletteLabel` to be different from `label` (page 2973) would be if it's more descriptive; another might be if there is no `label` (page 2973).

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- `setPaletteLabel:` (page 2979)

**Related Sample Code**

ToolbarSample

**Declared In**

NSToolbarItem.h

**setAction:**

Sets the receiver's action.

- (void)setAction:(SEL)*action*

**Parameters**

*action*

The action for the receiver.

**Discussion**

For a custom view item, this method calls `setAction:` on the view if it responds.

See *Action Messages* for additional information on action messages.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- `action` (page 2970)  
- `setTarget:` (page 2980)

**Related Sample Code**

GridCalendar

iSpend

PDFKitLinker2

ToolbarSample

**Declared In**

NSToolbarItem.h

## setAutovalidates:

Sets the receiver's auto validation flag.

- (void)setAutovalidates:(BOOL)*resistance*

### Parameters

*resistance*

YES to set the receiver to be automatically validated by the toolbar, otherwise NO.

### Discussion

By default `NSToolbar` automatically invokes the receiver's `validate` method on a regular basis. If your `validate` method is time consuming, you can disable auto validation on a per toolbar item basis.

### Availability

Available in Mac OS X v10.4 and later.

### See Also

- [autovalidates](#) (page 2970)

### Declared In

`NSToolbarItem.h`

## setEnabled:

Sets the receiver's enabled flag.

- (void)setEnabled:(BOOL)*enabled*

### Parameters

*enabled*

YES to enable the receiver, otherwise NO.

### Discussion

For a custom view item, this method calls `setEnabled:` on the view if it responds.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [isEnabled](#) (page 2972)

### Declared In

`NSToolbarItem.h`

## setImage:

Sets the image for the receiver or of the view.

- (void)setImage:(NSImage \*)*image*

### Parameters

*image*

The image for the receiver, or of the view if it has already been set for the receiver.

**Discussion**

For a custom view item (one whose view has already been set), this method calls `setImage:` on the view if it responds. If *image* contains multiple representations, `NSToolbarItem` chooses the most appropriately sized representation when displaying.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [image](#) (page 2971)
- [view](#) (page 2984)

`NSToolbarItem.h`

**setLabel:**

Sets the receiver's label that appears in the toolbar.

```
- (void)setLabel:(NSString *)label
```

**Parameters**

*label*

The receiver's label that appears in the toolbar. The length of the label should be appropriate and not too long. The label may be empty.

**Discussion**

The implication is that the toolbar will draw the label for the receiver, and a redraw is triggered by this method. The toolbar is in charge of the label area. For a discussion on labels, see "Setting a Toolbar Item's Representation".

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- (void)setVisibilityPriority:(NSInteger)*visibilityPriority*

**Parameters**

*visibilityPriority*

The visibility priority for the receiver. The values for *visibilityPriority* are described in [Item Priority](#) (page 2986).

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [visibilityPriority](#) (page 2985)

**Declared In**

NSToolbarItem.h

**tag**

Returns the receiver's tag.

- (NSInteger)tag

**Return Value**

The receiver's tag.

**Discussion**

You can use the tag for your own custom purpose.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setTag:](#) (page 2980)

**Declared In**

NSToolbarItem.h

**target**

Returns the receiver's target.

- (id)target

**Return Value**

The receiver's target.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setTarget:](#) (page 2980)

**Related Sample Code**

EnhancedDataBurn

ToolbarSample

**Declared In**

NSToolbarItem.h

**toolbar**

Returns the toolbar that is using the receiver.

- (NSToolbar \*)toolbar

**Return Value**

The toolbar that is using the receiver.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSToolbarItem.h

**toolTip**

Returns the tooltip used when the receiver is displayed in the toolbar.

- (NSString \*)toolTip

**Return Value**

The tooltip used when the receiver is displayed in the toolbar.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

## validate

This method is called by the receiver's toolbar during validation.

- (void)validate

**Discussion**

You may invoke this method directly if you have disabled automatic validation for an item—typically you do this for performance reasons if your validation code is slow. For further discussion, see “Validating Toolbar Items”.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setEnabled:](#) (page 2976)

**Declared In**

## Constants

**Standard Identifiers**

NSToolbarItem defines the following standard toolbar item identifiers.

```
NSString *NSToolbarSeparatorItemIdentifier;
NSString *NSToolbarSpaceItemIdentifier;
NSString *NSToolbarFlexibleSpaceItemIdentifier;
NSString *NSToolbarShowColorsItemIdentifier;
NSString *NSToolbarShowFontsItemIdentifier;
NSString *NSToolbarCustomizeToolbarItemIdentifier;
NSString *NSToolbarPrintItemIdentifier;
```

**Constants**

NSToolbarSeparatorItemIdentifier

The Separator item.

Available in Mac OS X v10.0 and later.

Declared in NSToolbarItem.h.

NSToolbarSpaceItemIdentifier

The Space item.

Available in Mac OS X v10.0 and later.

Declared in NSToolbarItem.h.

NSToolbarFlexibleSpaceItemIdentifier

The Flexible Space item.

Available in Mac OS X v10.0 and later.

Declared in NSToolbarItem.h.

`NSToolbarShowColorsItemIdentifier`

The Colors item. Shows the color panel.

Available in Mac OS X v10.0 and later.

Declared in `NSToolbarItem.h`.

`NSToolbarShowFontsItemIdentifier`

The Fonts item. Shows the font panel.

Available in Mac OS X v10.0 and later.

Declared in `NSToolbarItem.h`.

`NSToolbarCustomizeToolbarItemIdentifier`

The Customize item. Shows the customization palette.

Available in Mac OS X v10.0 and later.

Declared in `NSToolbarItem.h`.

`NSToolbarPrintItemIdentifier`

The Print item. Sends `printDocument:` to `firstResponder`, but you can change this in [toolbarWillAddItem:](#) (page 2963) if you need to do so.

Available in Mac OS X v10.0 and later.

Declared in `NSToolbarItem.h`.

### Discussion

The following figure illustrates the items in the order in which they are described above.

### Declared In

`NSToolbarItem.h`

## Item Priority

When a toolbar does not have enough space to fit all its items, it must push some items into the overflow menu. These values allow you to suggest a priority for a toolbar item.

```
enum {
 NSToolbarItemVisibilityPriorityStandard = 0,
 NSToolbarItemVisibilityPriorityLow = -1000,
 NSToolbarItemVisibilityPriorityHigh = 1000,
 NSToolbarItemVisibilityPriorityUser = 2000
};
```

### Constants

`NSToolbarItemVisibilityPriorityStandard`

The default visibility priority.

Available in Mac OS X v10.4 and later.

Declared in `NSToolbarItem.h`.

`NSToolbarItemVisibilityPriorityLow`

Items with this priority will be the first items to be pushed to the overflow menu.

Available in Mac OS X v10.4 and later.

Declared in `NSToolbarItem.h`.

`NSToolbarItemVisibilityPriorityHigh`

Items with this priority are less inclined to be pushed to the overflow menu.

Available in Mac OS X v10.4 and later.

Declared in `NSToolbarItem.h`.

`NSToolbarItemVisibilityPriorityUser`

Items with this priority are the last to be pushed to the overflow menu. Only the user should set items to this priority.

Available in Mac OS X v10.4 and later.

Declared in `NSToolbarItem.h`.

### Discussion

To suggest that an item always remain visible, give it a value greater than

`NSToolbarItemVisibilityPriorityStandard`, but less than `NSToolbarItemVisibilityPriorityUser`.

In configurable toolbars, users can control the priority of an item and the priority is autosaved by the `NSToolbar`.

These values are used by the [setVisibilityPriority:](#) (page 2982) and [visibilityPriority](#) (page 2985) methods:

## Overview

`NSToolbarItemGroup` is a subclass of `NSToolbarItem` which contains subitems. The views and labels of the subitems are used, but the parent's attributes take precedence.

To configure an instance of `NSToolbarItemGroup`, you first create the individual toolbar items that will be the subitems:

```
NSToolbarItem *item1 = [[[NSToolbarItem alloc] initWithItemIdentifier:@"Item1"]
 autorelease];
NSToolbarItem *item2 = [[[NSToolbarItem alloc] initWithItemIdentifier:@"Item2"]
 autorelease];
[item1 setImage:[NSImage imageNamed:@"LeftArrow"]];
[item2 setImage:[NSImage imageNamed:@"RightArrow"]];
[item1 setLabel:@"Prev"];
[item2 setLabel:@"Next"];
```

and then put them in a grouped item:

```
NSToolbarItemGroup *group = [[[NSToolbarItemGroup alloc]
 initWithItemIdentifier:@"GroupItem"] autorelease];
[group setSubitems:[NSArray arrayWithObjects:item1, item2, nil]];
```

In this configuration, you get two grouped items, and two labels. This differs from ordinary `NSToolbarItem` objects because they are attached—the user drags them together as a single item rather than separately.

If you set a label on the parent item:

```
[group setLabel:@"Navigate"];
```

you get two grouped items with one shared label.

If instead you set a view on the parent item, you get two labels with one shared view:

```
[group setView:someSegmentedControl];
```

## Tasks

### Working with Subitems

- `subitems` (page 2990)  
Returns the subitems for the receiver.
- `setSubitems:` (page 2990)  
Sets the subitems for the receiver.

## Instance Methods

### setSubitems:

Sets the subitems for the receiver.

```
- (void)setSubitems:(NSArray *)subitems
```

#### Parameters

*subitems*

An array of instances of `NSToolbarItem` objects that form the subitems for the receiver.

#### Discussion

You should call this method to set the subitems before returning the item to the toolbar.

`NSToolbarItemGroup` objects cannot contain other `NSToolbarItemGroup` objects as subitems.

#### Availability

Available in Mac OS X v10.5 and later.

#### Declared In

`NSToolbarItemGroup.h`

### subitems

Returns the subitems for the receiver.

```
- (NSArray *)subitems
```

#### Return Value

The subitems for the receiver.

#### Discussion

By default, an `NSToolbarItemGroup` instance has an empty array of subitems.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

## Overview

An `NSTrackingArea` object defines a region of view that generates mouse-tracking and cursor-update events when the mouse is over that region.

When creating a tracking-area object, you specify a rectangle (in the view's coordinate system), an owning object, and one or more options, along with (optionally) a dictionary of data. Once it's created, you add the tracking-area object to a view using the `addTrackingArea:` (page 3094) method. Depending on the options specified, the owner of the tracking area receives `mouseEntered:` (page 2134), `mouseExited:` (page 2134), `mouseMoved:` (page 2135), and `cursorUpdate:` (page 2121) messages when the mouse cursor enters, moves within, and leaves the tracking area. Currently the tracking area is restricted to rectangles.

An `NSTrackingArea` object belongs to its view rather than to its window. Consequently, you can add and remove tracking rectangles without needing to worry if the view has been added to a window. In addition, this design makes it possible for the Application Kit to compute the geometry of tracking areas automatically when a view moves and, in some cases, when a view changes size.

With `NSTrackingArea`, you can configure the scope of activity for mouse tracking. There are four options:

- The tracking area is active only when the view is first responder.
- The tracking area is active when the view is in the key window.
- The tracking area is active when the application is active.
- The tracking area is active always (even when the application is inactive).

Other options for `NSTrackingArea` objects include specifying that the tracking area should be synchronized with the visible rectangle of the view (`visibleRect` (page 3186)) and for generating `mouseEntered:` and `mouseExited:` events when the mouse is dragged.

Other `NSView` methods related to `NSTrackingArea` objects (in addition to `addTrackingArea:`) include `removeTrackingArea:` (page 3151) and `updateTrackingAreas` (page 3181). Views can override the latter method to recompute and replace their `NSTrackingArea` objects in certain situations, such as a change in the size of the `visibleRect`.

## Adopted Protocols

### NSCoding

- `encodeWithCoder:`
- `initWithCoder:`

### NSCopying

- `copyWithZone:`

## Tasks

### Initializing the Tracking-Area Object

- `initWithRect:options:owner:userInfo:` (page 2995)  
Initializes and returns an object defining a region of a view to receive mouse-tracking events, mouse-moved events, cursor-update events, or possibly all these events.

### Getting Object Attributes

- `options` (page 2996)  
Returns the options specified for the receiver.
- `owner` (page 2996)  
Returns the object owning the receiver, which is the recipient of mouse-tracking, mouse-movement, and cursor-update messages.
- `rect` (page 2996)  
Returns the rectangle defining the area encompassed by the receiver.
- `userInfo` (page 2997)  
Returns the dictionary containing the data associated with the receiver when it was created.

## Instance Methods

### **initWithRect:options:owner:userInfo:**

Initializes and returns an object defining a region of a view to receive mouse-tracking events, mouse-moved events, cursor-update events, or possibly all these events.

```
-(NSTrackingArea *)initWithRect:(NSRect)rect options:(NSTrackingAreaOptions)options
 owner:(id)owner userInfo:(NSDictionary *)userInfo
```

#### **Parameters**

*rect*

A rectangle that defines a region of a target view, in the view's coordinate system, for tracking events related to mouse tracking and cursor updating. The specified rectangle should not exceed the view's bounds rectangle.

*options*

One or more constants that specify the type of tracking area, the situations when the area is active, and special behaviors of the tracking area. See the description of [NSTrackingAreaOptions](#) (page 2997) and related constants for details. You must specify one or more options for the initialized object, in particular the type of tracking area; zero is not a valid value.

*owner*

The object to receive the requested mouse-tracking, mouse-moved, or cursor-update messages. It does not necessarily have to be the view associated with the created [NSTrackingArea](#) object, but should be an object capable of responding to the [NSResponder](#) methods [mouseEntered:](#) (page 2134), [mouseExited:](#) (page 2134), [mouseMoved:](#) (page 2135), and [cursorUpdate:](#) (page 2121).

*userInfo*

A dictionary containing arbitrary data for each mouse-entered, mouse-exited, and cursor-update event. When handling such an event you can obtain the dictionary by sending [userData](#) (page 1081) to the [NSEvent](#) object. (The dictionary is not available for mouse-moved events.) This parameter may be `nil`.

#### **Discussion**

After creating and initializing an [NSTrackingArea](#) object with this method, you must add it to a target view using the [addTrackingArea:](#) (page 3094) method. When changes in the view require changes in the geometry of its tracking areas, the Application Kit invokes [updateTrackingAreas](#) (page 3181). The view should implement this method to replace the current [NSTrackingArea](#) object with one with a recomputed area.

#### **Special Considerations**

Beginning with Mac OS X v10.5, the `initWithRect:options:owner:userInfo:`, along with the [addTrackingArea:](#) (page 3094) method of [NSView](#), replaces the [NSView](#) method [addTrackingRect:owner:userData:assumeInside:](#) (page 3095). The latter method will be deprecated, but supported for compatibility.

#### **Availability**

Available in Mac OS X v10.5 and later.

#### **See Also**

- [options](#) (page 2996)
- [owner](#) (page 2996)
- [rect](#) (page 2996)

- [userInfo](#) (page 2997)

### Related Sample Code

[MenuItemView](#)

[TrackIt](#)

### Declared In

[NSTrackingArea.h](#)

## options

Returns the options specified for the receiver.

- (NSTrackingAreaOptions)options

### Discussion

The options for an `NSTrackingArea` object are specified when the object is created. To determine if a particular option is in effect, perform a bitwise-AND operation with an [NSTrackingAreaOptions](#) (page 2997) constant and the value returned from this method, for example:

```
if ([trackingAreaObj options] & NSTrackingInVisibleRect != 0) {
 // do something appropriate
}
```

### Availability

Available in Mac OS X v10.5 and later.

### Declared In

[NSTrackingArea.h](#)

## owner

Returns the object owning the receiver, which is the recipient of mouse-tracking, mouse-movement, and cursor-update messages.

- (id)owner

### Availability

Available in Mac OS X v10.5 and later.

### Declared In

[NSTrackingArea.h](#)

## rect

Returns the rectangle defining the area encompassed by the receiver.

- (NSRect)rect

**Discussion**

The rectangle is specified in the local coordinate system of the associated view. If the [NSTrackingInVisibleRect](#) (page 2999) option is specified, the receiver is automatically synchronized with changes in the view's visible area ([visibleRect](#) (page 3186)) and the value returned from this method is ignored.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

`NSTrackingArea.h`

**userInfo**

Returns the dictionary containing the data associated with the receiver when it was created.

- (NSDictionary \*)userInfo

**Discussion**

Returns `nil` if no data was specified when the receiver was initialized. You can obtain this dictionary per event in each [mouseEntered:](#) (page 2134) and [mouseExited:](#) (page 2134) method by querying the passed-in `NSEvent` object with [userData](#) (page 1081).

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

`NSTrackingArea.h`

## Constants

**NSTrackingAreaOptions**

The data type defined for the constants specified in the *options* parameter of [initWithRect:options:owner:userInfo:](#) (page 2995). These constants are described below; you may specify multiple constants by performing a bitwise-OR operation with them.

```
typedef NSUInteger NSTrackingAreaOptions
```

**Declared In**

`AppKit/NSTrackingArea.h`

The following constants specify the type of the tracking area defined by an `NSTrackingArea` object. They request the type of messages the owning object should receive.

| Constant                                     | Description                                                                                                                                                                                                                                                                                    |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>NSTrackingMouseEnteredAndExited</code> | The owner of the tracking area receives <code>mouseEntered:</code> (page 2134) when the mouse cursor enters the area and <code>mouseExited:</code> (page 2134) events when the mouse leaves the area.<br>Available in Mac OS X v10.5 and later.<br>Declared in <code>NSTrackingArea.h</code> . |
| <code>NSTrackingMouseMoved</code>            | The owner of the tracking area receives <code>mouseMoved:</code> (page 2135) messages while the mouse cursor is within the area.<br>Available in Mac OS X v10.5 and later.<br>Declared in <code>NSTrackingArea.h</code> .                                                                      |
| <code>NSTrackingCursorUpdate</code>          | The owner of the tracking area receives <code>cursorUpdate:</code> (page 2121) messages when the mouse cursor enters the area; when the mouse leaves the area, the cursor is appropriately reset.<br>Available in Mac OS X v10.5 and later.<br>Declared in <code>NSTrackingArea.h</code> .     |

The following constants specify when the tracking area defined by an `NSTrackingArea` object is active. The owner receives all requested messages—which can include `mouseEntered:` (page 2134), `mouseExited:` (page 2134), `mouseMoved:` (page 2135), and `cursorUpdate:` (page 2121)—unless otherwise noted.

| Constant                                        | Description                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>NSTrackingActiveWhenFirstResponder</code> | The owner receives messages when the view is the first responder.<br>Available in Mac OS X v10.5 and later.<br>Declared in <code>NSTrackingArea.h</code> .                                                                                                                                                                                                                    |
| <code>NSTrackingActiveInKeyWindow</code>        | The owner receives messages when the view is in the key window.<br>Available in Mac OS X v10.5 and later.<br>Declared in <code>NSTrackingArea.h</code> .                                                                                                                                                                                                                      |
| <code>NSTrackingActiveInActiveApp</code>        | The owner receives messages when the application is active.<br>Available in Mac OS X v10.5 and later.<br>Declared in <code>NSTrackingArea.h</code> .                                                                                                                                                                                                                          |
| <code>NSTrackingActiveAlways</code>             | The owner receives messages regardless of first-responder status, window status, or application status. The <code>cursorUpdate:</code> (page 2121) message is <i>not</i> sent when the <code>NSTrackingCursorUpdate</code> (page 2998) option is specified along with this constant.<br>Available in Mac OS X v10.5 and later.<br>Declared in <code>NSTrackingArea.h</code> . |

The following constants specify various behaviors of the tracking defined by an `NSTrackingArea` object.

| Constant                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>NSTrackingAssume-Inside</code>           | <p>The first event is generated when the cursor leaves the tracking area, regardless if the cursor is inside the area when the <code>NSTrackingArea</code> is added to a view. If this option is not specified, the first event is generated when the cursor leaves the tracking area if the cursor is initially inside the area, or when the cursor enters the area if the cursor is initially outside it. Generally, you do not want to request this behavior.</p> <p>Available in Mac OS X v10.5 and later.<br/>Declared in <code>NSTrackingArea.h</code>.</p>                                                                                                                                                                                                                                                      |
| <code>NSTrackingIn-VisibleRect</code>          | <p>Mouse tracking occurs only in the visible rectangle of the view—in other words, that region of the tracking rectangle that is unobscured. Otherwise, the entire tracking area is active regardless of overlapping views. The <code>NSTrackingArea</code> object is automatically synchronized with changes in the view's visible area (<code>visibleRect</code> (page 3186)) and the value returned from <code>rect</code> (page 2996) is ignored.</p> <p>Available in Mac OS X v10.5 and later.<br/>Declared in <code>NSTrackingArea.h</code>.</p>                                                                                                                                                                                                                                                                 |
| <code>NSTrackingEnabled-DuringMouseDown</code> | <p>The owner receives <code>NSMouseEntered</code> events when the mouse cursor is dragged into the tracking area. If this option is not specified, the owner receives mouse-entered events when the mouse is moved (no buttons pressed) into the tracking area and on <code>NSLeftMouseDown</code> events after a mouse drag.</p> <p><code>NSMouseExited</code> and <code>NSMouseEntered</code> events are paired so their delivery is indirectly affected. That is, if a <code>NSMouseEntered</code> event is generated and the mouse cursor subsequently moves out of the tracking area, a <code>NSMouseExited</code> event is generated regardless if the mouse is moved or dragged, independent of this constant.</p> <p>Available in Mac OS X v10.5 and later.<br/>Declared in <code>NSTrackingArea.h</code>.</p> |

## Overview

The NSTreeController is a bindings compatible controller that manages a tree of objects. It provides selection and sort management. Its primary purpose is to act as the controller when binding NSOutlineView and NSBrowser instances to a hierarchial collection of objects.

An NSTreeController requires that you describe how the tree of objects is traversed by specifying the key path for child objects. All child objects for the tree must be key-value-coding compliant for the same child key path. If necessary you should implement accessor methods in your model classes, or categories on those classes, that map the child key to the appropriate class-specific method name.

An optional count key path can be specified that, if provided, returns the number of child objects available. Your model objects are expected to update the value of the count key path in a key-value-observing compliant method. You can optionally provide a leaf key path that specifies a key in your model object that returns YES if the object is a leaf node, and NO if it is not. Providing this key path prevents the NSTreeController from having to determine if a child object is a leaf node by examining the child object and as a result improve performance.

The root content object can be a single object, or an array of objects.

## Adopted Protocols

NSCoding  
- encodeWithCoder:

- initWithCoder:

#### NSCopying

- copyWithZone:

## Tasks

### Managing Sort Descriptors

- [setSortDescriptors:](#) (page 3020)  
Sets the sort descriptors used to arrange the receiver's contents.
- [sortDescriptors](#) (page 3021)  
Returns an array containing the sort descriptors used to arrange the receiver's content.

### Setting the Content

- [setContent:](#) (page 3018)  
Sets the receiver's content to *content*.
- [content](#) (page 3009)  
Returns the receiver's content object.

### Arranging Objects

- [arrangedObjects](#) (page 3006)  
Returns a proxy root tree node containing the receiver's sorted content objects.
- [rearrangeObjects](#) (page 3013)  
Use this method to trigger reordering of the receiver's content.

### Getting the Current Selection

- [setSelectionIndexPath:](#) (page 3019)  
Sets the receiver's current selection to *indexPath*, returning YES if the selection was changed.
- [selectionIndexPath](#) (page 3016)  
Returns the index path of the first object in the receiver's selection, or nil if there is no selection.
- [setSelectionIndexPaths:](#) (page 3020)  
Sets the receiver's current selection to *indexPaths*, returning YES if the selection was changed.
- [selectionIndexPaths](#) (page 3016)  
Returns an array containing the index paths of the receiver's currently selected objects in the content.
- [selectedObjects](#) (page 3015)  
Returns an array containing the receiver's selected objects.

- [selectedNodes](#) (page 3015)  
Returns an array of the receiver's selected tree nodes.

## Managing Selections

- [setSelectsInsertedObjects:](#) (page 3020)  
Sets whether the receiver will automatically select objects as they are inserted.
- [selectsInsertedObjects](#) (page 3016)  
Returns whether the receiver selects inserted objects automatically.
- [addSelectionIndexPaths:](#) (page 3006)  
Adds the objects at the specified *indexPaths* in the receiver's content to the current selection.
- [removeSelectionIndexPaths:](#) (page 3015)  
Removes the objects at the specified *indexPaths* from the receiver's current selection, returning YES if the selection was changed.
- [setAvoidsEmptySelection:](#) (page 3017)  
Sets whether the receiver will attempt to avoid an empty selection.
- [avoidsEmptySelection](#) (page 3007)  
Returns whether the receiver requires that the content array attempt to maintain a selection at all times.
- [setPreservesSelection:](#) (page 3019)  
Sets whether the receiver will attempt to preserve selection when the content changes.
- [preservesSelection](#) (page 3013)  
Returns whether the receiver will attempt to preserve the current selection when the content changes.
- [setAlwaysUsesMultipleValuesMarker:](#) (page 3017)  
Sets whether the receiver always returns the multiple values marker when multiple objects are selected, even if they have the same value.
- [alwaysUsesMultipleValuesMarker](#) (page 3006)  
Returns whether the receiver always returns the multiple values marker when multiple objects are selected, even if the selected items have the same value.

## Adding, Inserting and Removing Objects

- [add:](#) (page 3005)  
Adds an object to the receiver after the current selection.
- [addChild:](#) (page 3005)  
Adds a child object to the currently selected item.
- [canAddChild](#) (page 3007)  
Returns YES if a child object can be added to the receiver's content.
- [canInsert](#) (page 3008)  
Returns YES if an object can be inserted into the receiver's content.
- [canInsertChild](#) (page 3008)  
Returns YES if a child object can be inserted into the receiver's content.
- [insert:](#) (page 3010)  
Creates a new object of the class specified by *objectClass* and inserts it into the receiver's content.

- [insertChild:](#) (page 3010)  
Creates a new object of the class specified by `objectClass` and inserts it into the receiver's content as a child of the current selection.
- [insertObject:atArrangedObjectIndexPath:](#) (page 3011)  
Inserts *object* into the receiver's arranged objects array at the location specified by *indexPath*, and adds it to the receiver's content.
- [insertObjects:atArrangedObjectIndexPaths:](#) (page 3011)  
Inserts *objects* into the receiver's arranged objects array at the locations specified in *indexPaths*, and adds them to the receiver's content.
- [remove:](#) (page 3014)  
Removes the receiver's selected objects from the content.
- [removeObjectAtArrangedObjectIndexPath:](#) (page 3014)  
Removes the object at the specified *indexPath* in the receiver's arranged objects from the receiver's content.
- [removeObjectsAtArrangedObjectIndexPaths:](#) (page 3014)  
Removes the objects at the specified *indexPaths* in the receiver's arranged objects from the receiver's content.
- [moveNode:toIndexPath:](#) (page 3012)  
Moves the specified tree node to the new index path.
- [moveNodes:toIndexPath:](#) (page 3013)  
Moves the specified tree nodes to the new index path.

## Specifying Model Attributes

- [setChildrenKeyPath:](#) (page 3017)  
Sets the key path used by the receiver to access child objects to *key*.
- [childrenKeyPath](#) (page 3008)  
Returns the key path used to find the children in the receiver's objects.
- [setCountKeyPath:](#) (page 3018)  
Sets the key path used by the receiver to determine the number of objects at a node to *key*.
- [childrenKeyPathForNode:](#) (page 3009)  
Returns the key path used to find the children in the specified tree node.
- [countKeyPath](#) (page 3009)  
Returns the key path used to find the number of children for a node.
- [countKeyPathForNode:](#) (page 3010)  
Returns the key path that provides the number of children for a specified node.
- [setLeafKeyPath:](#) (page 3018)  
Sets the key path used by the receiver to determine if an object is a leaf node to *key*.
- [leafKeyPath](#) (page 3012)  
Returns the key path used by the receiver to determine if a node is a leaf key.
- [leafKeyPathForNode:](#) (page 3012)  
Returns the key path that specifies whether the node is a leaf node.

## Instance Methods

### **add:**

Adds an object to the receiver after the current selection.

- (void)add:(id)sender

#### **Discussion**

The *sender* is typically the object that invoked this method.

If the receiver is in object mode `newObject` is called and the returned object is added to the collection. If the receiver is in entity mode a new object is created that is appropriate as specified by the entity, and `newObject` is not used.

#### **Special Considerations**

Beginning with Mac OS X v10.4 the result of this method is deferred until the next iteration of the runloop so that the error presentation mechanism can provide feedback as a sheet.

#### **Availability**

Available in Mac OS X v10.4 and later.

#### **See Also**

- [remove:](#) (page 3014)

#### **Declared In**

`NSTreeController.h`

### **addChild:**

Adds a child object to the currently selected item.

- (void)addChild:(id)sender

#### **Discussion**

The *sender* is typically the object that invoked this method.

If the receiver is in object mode `newObject` is called and the returned object is added as a child. If the receiver is in entity mode a new object is created that is appropriate for the relationship as specified by the entity, and `newObject` is not used.

#### **Special Considerations**

Beginning with Mac OS X v10.4 the result of this method is deferred until the next iteration of the runloop so that the error presentation mechanism can provide feedback as a sheet.

#### **Availability**

Available in Mac OS X v10.4 and later.

#### **See Also**

- [remove:](#) (page 3014)

**Declared In**

NSTreeController.h

**addSelectionIndexPaths:**

Adds the objects at the specified *indexPaths* in the receiver's content to the current selection.

- (BOOL)addSelectionIndexPaths:(NSArray \*)*indexPaths*

**Discussion**

Attempting to change the selection may cause a `commitEditing` message which fails, thus denying the selection change.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [removeSelectionIndexPaths:](#) (page 3015)

**Declared In**

NSTreeController.h

**alwaysUsesMultipleValuesMarker**

Returns whether the receiver always returns the multiple values marker when multiple objects are selected, even if the selected items have the same value.

- (BOOL)alwaysUsesMultipleValuesMarker

**Discussion**

The default is NO.

This property is observable using key-value observing.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [setAlwaysUsesMultipleValuesMarker:](#) (page 3017)

**Declared In**

NSTreeController.h

**arrangedObjects**

Returns a proxy root tree node containing the receiver's sorted content objects.

- (id)arrangedObjects

**Discussion**

This property is observable using key-value observing.

**Special Considerations**

Prior to Mac OS X v10.5 this method returned an opaque root node representing all the currently displayed objects. This method should be used for binding, no assumption should be made about what methods this object supports.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

– [rearrangeObjects](#) (page 3013)

**Declared In**

NSTreeController.h

**avoidsEmptySelection**

Returns whether the receiver requires that the content array attempt to maintain a selection at all times.

– (BOOL)avoidsEmptySelection

**Discussion**

The default is YES.

This property is observable using key-value observing.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

– [setAvoidsEmptySelection:](#) (page 3017)

**Declared In**

NSTreeController.h

**canAddChild**

Returns YES if a child object can be added to the receiver's content.

– (BOOL)canAddChild

**Discussion**

This property is observable using key-value observing.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

– [canInsertChild](#) (page 3008)

**Declared In**

NSTreeController.h

## canInsert

Returns YES if an object can be inserted into the receiver's content.

- (BOOL)canInsert

### Discussion

This property is observable using key-value observing.

### Availability

Available in Mac OS X v10.4 and later.

### See Also

- [canInsertChild](#) (page 3008)

### Declared In

NSTreeController.h

## canInsertChild

Returns YES if a child object can be inserted into the receiver's content.

- (BOOL)canInsertChild

### Discussion

This property is observable using key-value observing.

### Availability

Available in Mac OS X v10.4 and later.

### See Also

- [insertChild:](#) (page 3010)

### Declared In

NSTreeController.h

## childrenKeyPath

Returns the key path used to find the children in the receiver's objects.

- (NSString \*)childrenKeyPath

### Availability

Available in Mac OS X v10.4 and later.

### See Also

- [setChildrenKeyPath:](#) (page 3017)

### Declared In

NSTreeController.h

## childrenKeyPathForNode:

Returns the key path used to find the children in the specified tree node.

- (NSString \*)childrenKeyPathForNode:(NSTreeNode \*)*node*

### Parameters

*node*

A tree node in the receiver.

### Return Value

A string containing the key path in *node* that provides the child nodes.

### Availability

Available in Mac OS X v10.5 and later.

### Declared In

NSTreeController.h

## content

Returns the receiver's content object.

- (id)content

### Discussion

This property is observable using key-value observing.

### Availability

Available in Mac OS X v10.4 and later.

### See Also

- [setContent:](#) (page 3018)

### Declared In

NSTreeController.h

## countKeyPath

Returns the key path used to find the number of children for a node.

- (NSString \*)countKeyPath

### Availability

Available in Mac OS X v10.4 and later.

### See Also

- [setCountKeyPath:](#) (page 3018)

### Declared In

NSTreeController.h

## countKeyPathForNode:

Returns the key path that provides the number of children for a specified node.

- (NSString \*)countKeyPathForNode:(NSTreeNode \*)*node*

### Parameters

*node*

A tree node in the receiver.

### Return Value

A string containing the key path in *node* that provides the number of children.

### Availability

Available in Mac OS X v10.5 and later.

### Declared In

NSTreeController.h

## insert:

Creates a new object of the class specified by `objectClass` and inserts it into the receiver's content.

- (void)insert:(id)*sender*

### Discussion

The *sender* is typically the object that invoked this method.

If the receiver is in object mode `newObject` is called and the returned object is inserted into the collection. If the receiver is in entity mode a new object is created that is appropriate as specified by the entity, and `newObject` is not used.

### Special Considerations

Beginning with Mac OS X v10.4 the result of this method is deferred until the next iteration of the runloop so that the error presentation mechanism can provide feedback as a sheet.

### Availability

Available in Mac OS X v10.4 and later.

### See Also

- [add:](#) (page 3005)

### Declared In

NSTreeController.h

## insertChild:

Creates a new object of the class specified by `objectClass` and inserts it into the receiver's content as a child of the current selection.

- (void)insertChild:(id)*sender*

### Discussion

The *sender* is typically the object that invoked this method.

If the receiver is in object mode `newObject` is called and the returned object is inserted as a child. If the receiver is in entity mode a new object is created that is appropriate for the relationship as specified by the entity, and `newObject` is not used.

### Special Considerations

Beginning with Mac OS X v10.4 the result of this method is deferred until the next iteration of the runloop so that the error presentation mechanism can provide feedback as a sheet.

### Availability

Available in Mac OS X v10.4 and later.

### See Also

– [add:](#) (page 3005)

### Declared In

`NSTreeController.h`

## insertObject:atArrangedObjectIndexPath:

Inserts *object* into the receiver’s arranged objects array at the location specified by *indexPath*, and adds it to the receiver’s content.

```
– (void)insertObject:(id)object atArrangedObjectIndexPath:(NSIndexPath *)indexPath
```

### Availability

Available in Mac OS X v10.4 and later.

### See Also

– [insertObjects:atArrangedObjectIndexPaths:](#) (page 3011)

### Declared In

`NSTreeController.h`

## insertObjects:atArrangedObjectIndexPaths:

Inserts *objects* into the receiver’s arranged objects array at the locations specified in *indexPaths*, and adds them to the receiver’s content.

```
– (void)insertObjects:(NSArray *)objects atArrangedObjectIndexPaths:(NSArray *)indexPaths
```

### Availability

Available in Mac OS X v10.4 and later.

### See Also

– [removeObjectAtArrangedObjectIndexPath:](#) (page 3014)

### Declared In

`NSTreeController.h`

## leafKeyPath

Returns the key path used by the receiver to determine if a node is a leaf key.

- (NSString \*)leafKeyPath

### Availability

Available in Mac OS X v10.4 and later.

### See Also

- [setLeafKeyPath:](#) (page 3018)

### Declared In

NSTreeController.h

## leafKeyPathForNode:

Returns the key path that specifies whether the node is a leaf node.

- (NSString \*)leafKeyPathForNode:(NSTreeNode \*)node

### Parameters

*node*

A tree node in the receiver.

### Return Value

A string containing the key path in *node* that specifies that the node is a leaf node.

### Availability

Available in Mac OS X v10.5 and later.

### Declared In

NSTreeController.h

## moveNode:toIndexPath:

Moves the specified tree node to the new index path.

- (void)moveNode:(NSTreeNode \*)node toIndexPath:(NSIndexPath \*)indexPath

### Parameters

*node*

A tree node.

*indexPath*

An index path specifying the new position in the receiver's content.

### Availability

Available in Mac OS X v10.5 and later.

### Declared In

NSTreeController.h

## moveNodes:toIndexPath:

Moves the specified tree nodes to the new index path.

- (void)moveNodes:(NSArray \*)*nodes* toIndexPath:(NSIndexPath \*)*startingIndexPath*

### Parameters

*nodes*

An array of tree nodes.

*startingIndexPath*

An index path specifying the starting position to move the tree nodes to in the receiver's content.

### Availability

Available in Mac OS X v10.5 and later.

### Declared In

NSTreeController.h

## preservesSelection

Returns whether the receiver will attempt to preserve the current selection when the content changes.

- (BOOL)preservesSelection

### Discussion

The default is YES.

This property is observable using key-value observing.

### Availability

Available in Mac OS X v10.4 and later.

### See Also

- [setPreservesSelection:](#) (page 3019)

### Declared In

NSTreeController.h

## rearrangeObjects

Use this method to trigger reordering of the receiver's content.

- (void)rearrangeObjects

### Discussion

Subclasses should invoke this method if any parameter that affects the arranged objects changes.

### Availability

Available in Mac OS X v10.4 and later.

### See Also

- [arrangedObjects](#) (page 3006)

**Declared In**

NSTreeController.h

**remove:**

Removes the receiver's selected objects from the content.

- (void)remove:(id)sender

**Discussion**

The *sender* is typically the object that invoked this method.

**Special Considerations**

Beginning with Mac OS X v10.4 the result of this method is deferred until the next iteration of the runloop so that the error presentation mechanism can provide feedback as a sheet.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [add:](#) (page 3005)

**Declared In**

NSTreeController.h

**removeObjectAtArrangedObjectIndexPath:**

Removes the object at the specified *indexPath* in the receiver's arranged objects from the receiver's content.

- (void)removeObjectAtArrangedObjectIndexPath:(NSIndexPath \*)indexPath

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [removeObjectsAtArrangedObjectIndexPaths:](#) (page 3014)

**Declared In**

NSTreeController.h

**removeObjectsAtArrangedObjectIndexPaths:**

Removes the objects at the specified *indexPaths* in the receiver's arranged objects from the receiver's content.

- (void)removeObjectsAtArrangedObjectIndexPaths:(NSArray \*)indexPaths

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [removeObjectAtArrangedObjectIndexPath:](#) (page 3014)

**Declared In**

NSTreeController.h

**removeSelectionIndexPaths:**

Removes the objects at the specified indexPaths from the receiver's current selection, returning YES if the selection was changed.

```
- (BOOL)removeSelectionIndexPaths:(NSArray *)indexPaths
```

**Discussion**

Attempting to change the selection may cause a `commitEditing` message which fails, thus denying the selection change.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [addSelectionIndexPaths:](#) (page 3006)

**Declared In**

NSTreeController.h

**selectedNodes**

Returns an array of the receiver's selected tree nodes.

```
- (NSArray *)selectedNodes
```

**Return Value**

An array containing the receiver's selected tree nodes

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSTreeController.h

**selectedObjects**

Returns an array containing the receiver's selected objects.

```
- (NSArray *)selectedObjects
```

**Discussion**

This property is observable using key-value observing.

**Availability**

Available in Mac OS X v10.4 and later.

**Related Sample Code**

QTMetadataEditor

**Declared In**

NSTreeController.h

**selectionIndexPath**

Returns the index path of the first object in the receiver's selection, or `nil` if there is no selection.

- (NSIndexPath \*)selectionIndexPath

**Discussion**

This property is observable using key-value observing.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [selectionIndexPaths](#) (page 3016)

**Declared In**

NSTreeController.h

**selectionIndexPaths**

Returns an array containing the index paths of the receiver's currently selected objects in the content.

- (NSArray \*)selectionIndexPaths

**Discussion**

This property is observable using key-value observing.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [selectionIndexPath](#) (page 3016)

**Declared In**

NSTreeController.h

**selectsInsertedObjects**

Returns whether the receiver selects inserted objects automatically.

- (BOOL)selectsInsertedObjects

**Discussion**

The default is YES.

This property is observable using key-value observing.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [setSelectsInsertedObjects:](#) (page 3020)

**Declared In**

NSTreeController.h

**setAlwaysUsesMultipleValuesMarker:**

Sets whether the receiver always returns the multiple values marker when multiple objects are selected, even if they have the same value.

- (void)setAlwaysUsesMultipleValuesMarker:(BOOL)flag

**Discussion**

Setting *flag* to YES can increase performance if your application doesn't allow editing multiple values. The default is NO.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [alwaysUsesMultipleValuesMarker](#) (page 3006)

**Declared In**

NSTreeController.h

**setAvoidsEmptySelection:**

Sets whether the receiver will attempt to avoid an empty selection.

- (void)setAvoidsEmptySelection:(BOOL)flag

**Discussion**

If *flag* is YES then the receiver will maintain a selection unless there are no objects in the content. The default is YES.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [avoidsEmptySelection](#) (page 3007)

**Declared In**

NSTreeController.h

**setChildrenKeyPath:**

Sets the key path used by the receiver to access child objects to *key*.

- (void)setChildrenKeyPath:(NSString \*)key

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

– [childrenKeyPath](#) (page 3008)

**Declared In**

NSTreeController.h

**setContent:**

Sets the receiver's content to *content*.

– (void)setContent:(id)*content*

**Discussion**

The *content* can be an array of objects, or a single root object.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

– [content](#) (page 3009)

**Declared In**

NSTreeController.h

**setCountKeyPath:**

Sets the key path used by the receiver to determine the number of objects at a node to *key*.

– (void)setCountKeyPath:(NSString \*)*key*

**Discussion**

Specifying this key path, if the data is available in the model object, can increase performance, but disables insert and remove functionality.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

– [countKeyPath](#) (page 3009)

**Declared In**

NSTreeController.h

**setLeafKeyPath:**

Sets the key path used by the receiver to determine if an object is a leaf node to *key*.

– (void)setLeafKeyPath:(NSString \*)*key*

**Discussion**

Specifying this key path is optional. If the receiver is able to determine that a node is a leaf node, it can disable inserting or adding children to those nodes.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

– [leafKeyPath](#) (page 3012)

**Declared In**

NSTreeController.h

**setPreservesSelection:**

Sets whether the receiver will attempt to preserve selection when the content changes.

– (void)setPreservesSelection:(BOOL)*flag*

**Discussion**

If *flag* is YES then the selection will be preserved, if possible. The default is YES.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

– [preservesSelection](#) (page 3013)

**Declared In**

NSTreeController.h

**setSelectionIndexPath:**

Sets the receiver's current selection to *indexPath*, returning YES if the selection was changed.

– (BOOL)setSelectionIndexPath:(NSIndexPath \*)*indexPath*

**Discussion**

Attempting to change the selection may cause a `commitEditing` message which fails, thus denying the selection change.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

– [selectionIndexPaths](#) (page 3016)

**Declared In**

NSTreeController.h

## setSelectionIndexPaths:

Sets the receiver's current selection to *indexPaths*, returning YES if the selection was changed.

- (BOOL)setSelectionIndexPaths:(NSArray \*)*indexPaths*

### Discussion

Attempting to change the selection may cause a `commitEditing` message which fails, thus denying the selection change.

### Availability

Available in Mac OS X v10.4 and later.

### See Also

- [setSelectionIndexPath:](#) (page 3019)

### Declared In

NSTreeController.h

## setSelectsInsertedObjects:

Sets whether the receiver will automatically select objects as they are inserted.

- (void)setSelectsInsertedObjects:(BOOL) *flag*

### Discussion

If *flag* is YES then items will be selected upon insertion. The default is YES.

### Availability

Available in Mac OS X v10.4 and later.

### See Also

- [selectsInsertedObjects](#) (page 3016)

### Declared In

NSTreeController.h

## setSortDescriptors:

Sets the sort descriptors used to arrange the receiver's contents.

- (void)setSortDescriptors:(NSArray \*)*sortDescriptors*

### Discussion

The *sortDescriptors* parameter contains an array of `NSSortDescriptor` objects. Setting *sortDescriptors* to nil causes the contents to be arranged in their natural order.

### Availability

Available in Mac OS X v10.4 and later.

### See Also

- [sortDescriptors](#) (page 3021)

**Declared In**

NSTreeController.h

**sortDescriptors**

Returns an array containing the sort descriptors used to arrange the receiver's content.

- (NSArray \*)sortDescriptors

**Discussion**

Returns `nil` if the receiver has no sort descriptors configured. This property is observable using key-value observing.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [setSortDescriptors:](#) (page 3020)

**Declared In**

## Overview

`NSTreeNode` simplifies the creation and management of trees of objects. Each tree node represents a model object. A tree node with `nil` as its parent node is considered the root of the tree.

## Tasks

### Creating Tree Nodes

- + `treeNodeWithRepresentedObject:` (page 3024)  
Creates and returns a tree node that represents the specified object.
- `initWithRepresentedObject:` (page 3025)  
Initializes a newly allocated tree node that represents the specified object.

### Getting Information About a Node

- `representedObject` (page 3027)  
Returns the object the tree node represents.
- `indexPath` (page 3025)  
Returns the position of the receiver relative to its root parent.
- `isLeaf` (page 3026)  
Returns whether the receiver is a leaf node.
- `childNodes` (page 3024)  
Returns an array containing receiver's child nodes.

- [mutableChildNodes](#) (page 3026)  
Returns a mutable array that provides read-write access to the receiver's child nodes.
- [descendantNodeAtIndexPath:](#) (page 3025)  
Returns the receiver's descendent at the specified index path.
- [parentNode](#) (page 3026)  
Returns the receiver's parent node.

## Sorting the Subtree

- [sortWithSortDescriptors:recursively:](#) (page 3027)  
Sorts the receiver's subtree using the values of the represented objects with the specified sort descriptors.

## Class Methods

### treeNodeWithRepresentedObject:

Creates and returns a tree node that represents the specified object.

```
+ (id)treeNodeWithRepresentedObject:(id)modelObject
```

#### Parameters

*modelObject*

The object the tree node represents.

#### Return Value

An initialized tree node that represents *modelObject*.

#### Availability

Available in Mac OS X v10.5 and later.

#### Declared In

`NSTreeNode.h`

## Instance Methods

### childNodes

Returns an array containing receiver's child nodes.

```
- (NSArray *)childNodes
```

#### Return Value

An array containing the receiver's child nodes.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

`NSTreeNode.h`

**descendantNodeAtIndexPath:**

Returns the receiver's descendent at the specified index path.

```
- (NSTreeNode *)descendantNodeAtIndexPath:(NSIndexPath *)indexPath
```

**Parameters**

*indexPath*

An index path specifying a descendent of the receiver.

**Return Value**

A tree node, or `nil` if the node does not exist.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

`NSTreeNode.h`

**indexPath**

Returns the position of the receiver relative to its root parent.

```
- (NSIndexPath *)indexPath
```

**Return Value**

An index path that represents the receiver's position relative to the tree's root node.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

`NSTreeNode.h`

**initWithRepresentedObject:**

Initializes a newly allocated tree node that represents the specified object.

```
- (id)initWithRepresentedObject:(id)modelObject
```

**Parameters**

*modelObject*

The object the tree node represents.

**Return Value**

An initialized tree node that represents *modelObject*.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

`NSTreeNode.h`

**isLeaf**

Returns whether the receiver is a leaf node.

- (BOOL)isLeaf

**Return Value**

YES if the receiver is a leaf node (has no child nodes), otherwise NO.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

`NSTreeNode.h`

**mutableChildNodes**

Returns a mutable array that provides read-write access to the receiver's child nodes.

- (NSMutableArray \*)mutableChildNodes

**Return Value**

A mutable array that provides read-write access to the receiver's child nodes.

**Discussion**

Nodes that are inserted into this array have their parent nodes set to the receiver. Nodes that are removed from this array automatically have their parent node set to `nil`. The array that is returned is observable using key-value observing.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

`NSTreeNode.h`

**parentNode**

Returns the receiver's parent node.

- (NSTreeNode \*)parentNode

**Return Value**

The receiver's parent node.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSTreeNode.h

**representedObject**

Returns the object the tree node represents.

```
- (id)representedObject
```

**Return Value**

The object the tree node represents.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSTreeNode.h

**sortWithSortDescriptors:recursively:**

Sorts the receiver's subtree using the values of the represented objects with the specified sort descriptors.

```
- (void)sortWithSortDescriptors:(NSArray *)sortDescriptors
 recursively:(BOOL)recursively
```

**Parameters**

*sortDescriptors*

Array of sort descriptors specifying how to sort the represented objects.

*recursively*

A Boolean that specifies whether the child nodes should be sorted recursively.

**Discussion**

All the represented objects in the child nodes must be key-value coding compliant for the keys specified in the sort descriptors.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSTreeNode.h

| <b>Companion guides</b> | Text System Overview<br>Text Layout Programming Guide for Cocoa |

## Overview

`NSLayoutManager` uses concrete subclasses of this abstract class, `NSTypesetter`, to perform line layout, which includes word wrapping, hyphenation, and line breaking in either vertical or horizontal rectangles. By default, the text system uses the concrete subclass `NSATSTypesetter`.

## Subclassing Notes

---

`NSTypesetter` provides concrete subclasses with default implementation interfacing with the Cocoa text system. By subclassing `NSTypesetter`, an application can override the `layoutParagraphAtPoint:` (page 3048) method to integrate a custom typesetting engine into the Cocoa text system. On the other hand, an application can subclass `NSATSTypesetter` and override the glyph storage interface to integrate the concrete subclass into its own custom layout system.

`NSTypesetter` methods belong to three categories: glyph storage interface methods, layout phase interface methods, and core typesetter methods. The glyph storage interface methods map to `NSLayoutManager` methods. The typesetter itself calls these methods, and their default implementations call the Cocoa layout manager. An `NSTypesetter` subclass can override these methods to call its own glyph storage facility, in which case it should override all of them. (This does not preclude the overridden method calling its superclass implementation if appropriate.)

The layout phase interface provides control points similar to delegate methods; if implemented, the system invokes these methods to notify an `NSTypesetter` subclass of events in the layout process so it can intervene as needed.

The remainder of the `NSTypesetter` methods are primitive, core typesetter methods. The core typesetter methods correlate with typesetting state attributes; the layout manager calls these methods to store its values before starting the layout process. If you subclass `NSTypesetter` and override the glyph storage interface methods, you can call the core methods to control the typesetter directly.

## Glyph Storage Interface

---

Override these methods to use `NSTypesetter`'s built-in concrete subclass, `NSATSTypesetter`, with a custom glyph storage and layout system other than the Cocoa layout manager and text container mechanism.

`characterRangeForGlyphRange:actualGlyphRange:` (page 3040)  
`glyphRangeForCharacterRange:actualCharacterRange:` (page 3045)  
`getGlyphsInRange:glyphs:characterIndexes:glyphInscriptions:elasticBits:bidirectionalLevels:` (page 3042)  
`getLineFragmentRect:usedRect:remainingRect:forStartingGlyphAtIndex:proposedRect:lineSpacing:paragraphSpacingBefore:paragraphSpacingAfter:` (page 3044)  
`setLineFragmentRect:forGlyphRange:usedRect:baselineOffset:` (page 3056)  
`substituteGlyphsInRange:withGlyphs:` (page 3060)  
`insertGlyph:atGlyphIndex:characterIndex:` (page 3046)  
`deleteGlyphsInRange:` (page 3041)  
`setNotShownAttribute:forGlyphRange:` (page 3057)  
`setDrawsOutsideLineFragment:forGlyphRange:` (page 3054)  
`setLocation:withAdvancements:forStartOfGlyphRange:` (page 3056)  
`setAttachmentSize:forGlyphRange:` (page 3052)  
`setBidiLevels:forGlyphRange:` (page 3053)

## Layout Phase Interface

---

Override these methods to customize the text layout process, including modifying line fragments, controlling line breaking and hyphenation, and controlling the behavior of tabs and other control glyphs.

`willSetLineFragmentRect:forGlyphRange:usedRect:baselineOffset:` (page 3062)  
`shouldBreakLineByWordBeforeCharacterAtIndex:` (page 3059)  
`shouldBreakLineByHyphenatingBeforeCharacterAtIndex:` (page 3059)  
`hyphenationFactorForGlyphAtIndex:` (page 3045)  
`hyphenCharacterForGlyphAtIndex:` (page 3046)  
`boundingBoxForControlGlyphAtIndex:forTextContainer:proposedLineFragment:glyphPosition:characterIndex:` (page 3039)

## Tasks

### Getting a Typesetter

- + `sharedSystemTypesetterForBehavior:` (page 3036)  
Returns a shared instance of a reentrant typesetter that implements typesetting with the specified behavior.
- + `sharedSystemTypesetter` (page 3036) **Deprecated in Mac OS X v10.4**  
Returns a shared instance of a reentrant typesetter.

### Getting Information About a Typesetter

- + `defaultTypesetterBehavior` (page 3035)  
Returns the default typesetter behavior.

### Getting Information About Glyphs

- + `printingAdjustmentInLayoutManager:forNominallySpacedGlyphRange:packedGlyphs:count:` (page 3035)  
Returns the interglyph spacing in the specified range when sent to a printer.
- `baselineOffsetInLayoutManager:glyphIndex:` (page 3038) **Deprecated in Mac OS X v10.4** **Deprecated in Mac OS X v10.3**  
Returns the distance from the bottom of the bounding box of a specified glyph to its baseline.

### Managing the Layout Manager

- `layoutManager` (page 3048)  
Returns the layout manager for the text being typeset.
- `setUsesFontLeading:` (page 3058)  
Sets whether the typesetter uses the leading (or line gap) value specified in the font metric information.
- `usesFontLeading` (page 3062)  
Returns whether the typesetter uses the leading (or line gap) value specified in the font metric information of the current font.
- `setTypesetterBehavior:` (page 3058)  
Sets the default typesetter behavior, which affects glyph spacing and line height.
- `typesetterBehavior` (page 3061)  
Returns the current typesetter behavior.
- `setHyphenationFactor:` (page 3055)  
Sets the threshold controlling when hyphenation is attempted.
- `hyphenationFactor` (page 3045)  
Returns the current hyphenation factor.

## Managing Text Containers

- `currentTextContainer` (page 3041)  
Returns the text container for the text being typeset.
- `textContainers` (page 3061)  
Returns an array containing the text containers belonging to the current layout manager.
- `setLineFragmentPadding:` (page 3055)  
Sets the amount (in points) by which text is inset within line fragment rectangles.
- `lineFragmentPadding` (page 3048)  
Returns the current line fragment padding, in points.

## Mapping Screen and Printer Fonts

- `substituteFontForFont:` (page 3060)  
Returns a screen font suitable for use in place of a given font.

## Handling Control Characters

- `textTabForGlyphLocation:writingDirection:maxLocation:` (page 3061)  
Returns the text tab next closest to a given glyph location within the given parameters.
- `actionForControlCharacterAtIndex:` (page 3037)  
Returns the action associated with a control character.

## Bidirectional Text Processing

- `setBidiProcessingEnabled:` (page 3054)  
Controls whether the typesetter performs bidirectional text processing.
- `bidiProcessingEnabled` (page 3039)  
Returns whether bidirectional text processing is enabled.

## Accessing Paragraph Typesetting Information

- `currentParagraphStyle` (page 3041)  
Returns the paragraph style object for the text being typeset.
- `setAttributedString:` (page 3053)  
Sets the text backing store on which this typesetter operates.
- `attributedString` (page 3037)  
Returns the text backing store, usually an instance of `NSTextStorage`.
- `setParagraphGlyphRange:separatorGlyphRange:` (page 3057)  
Sets the current glyph range being processed.
- `paragraphGlyphRange` (page 3050)  
Returns the glyph range currently being processed.

- [paragraphSeparatorGlyphRange](#) (page 3051)  
Returns the current paragraph separator range.
- [paragraphCharacterRange](#) (page 3049)  
Returns the character range currently being processed.
- [paragraphSeparatorCharacterRange](#) (page 3050)  
Returns the current paragraph separator character range.
- [attributesForExtraLineFragment](#) (page 3037)  
Returns the attributes used to lay out the extra line fragment.

## Paragraph Layout

- [layoutParagraphAtPoint:](#) (page 3048)  
Lays out glyphs in the current glyph range until the next paragraph separator is reached.
- [beginParagraph](#) (page 3039)  
Sets up layout parameters at the beginning of a paragraph.
- [endParagraph](#) (page 3042)  
Sets up layout parameters at the end of a paragraph.
- [beginLineWithGlyphAtIndex:](#) (page 3038)  
Sets up layout parameters at the beginning of a line during typesetting.
- [endLineWithGlyphRange:](#) (page 3042)  
Sets up layout parameters at the end of a line during typesetting.

## Line and Paragraph Spacing

- [lineSpacingAfterGlyphAtIndex:withProposedLineFragmentRect:](#) (page 3049)  
Returns the line spacing in effect following the specified glyph.
- [paragraphSpacingAfterGlyphAtIndex:withProposedLineFragmentRect:](#) (page 3051)  
Returns the paragraph spacing that is in effect after the specified glyph.
- [paragraphSpacingBeforeGlyphAtIndex:withProposedLineFragmentRect:](#) (page 3052)  
Returns the number of points of space—added before a paragraph—that is in effect before the specified glyph.

## Glyph Caching

- [setHardInvalidation:forGlyphRange:](#) (page 3054)  
Sets whether to force the layout manager to invalidate the specified portion of the glyph cache when invalidating layout.

## Laying out Glyphs

- [boundingBoxForControlGlyphAtIndex:forTextContainer:proposedLineFragment:glyphPosition:characterIndex:](#) (page 3039)  
Returns the bounding rectangle for the specified control glyph with the specified parameters.

- `getLineFragmentRect:usedRect:forParagraphSeparatorGlyphRange:atProposedOrigin:` (page 3043)  
Calculates the line fragment rectangle and line fragment used rectangle for blank lines.
- `getLineFragmentRect:usedRect:remainingRect:forStartingGlyphAtIndex:proposedRect:lineSpacing:paragraphSpacingBefore:paragraphSpacingAfter:` (page 3044)  
Calculates line fragment rectangle, line fragment used rectangle, and remaining rectangle for a line fragment.
- `hyphenCharacterForGlyphAtIndex:` (page 3046)  
Returns the hyphen character to be inserted after the specified glyph.
- `hyphenationFactorForGlyphAtIndex:` (page 3045)  
Returns the hyphenation factor in effect at a specified location.
- `shouldBreakLineByHyphenatingBeforeCharacterAtIndex:` (page 3059)  
Returns whether the line being laid out should be broken by hyphenating at the specified character.
- `shouldBreakLineByWordBeforeCharacterAtIndex:` (page 3059)  
Returns whether the line being laid out should be broken by a word break at the specified character.
- `layoutGlyphsInLayoutManager:startingAtGlyphIndex:maxNumberOfLineFragments:nextGlyphIndex:` (page 3047) **Deprecated in Mac OS X v10.4**  
Lays out glyphs in the specified layout manager starting at a specified glyph.
- `willSetLineFragmentRect:forGlyphRange:usedRect:baselineOffset:` (page 3062) **Deprecated in Mac OS X v10.4**  
Called by the typesetter just prior to storing the actual line fragment rectangle location in the layout manager.

## Interfacing with Glyph Storage

- `characterRangeForGlyphRange:actualGlyphRange:` (page 3040)  
Returns the range for the characters in the receiver's text store that are mapped to the specified glyphs.
- `deleteGlyphsInRange:` (page 3041)  
Deletes the specified glyphs from the glyph cache maintained by the layout manager.
- `substituteGlyphsInRange:withGlyphs:` (page 3060)  
Replaces the specified glyphs with specified replacement glyphs.
- `getGlyphsInRange:glyphs:characterIndexes:glyphInscriptions:elasticBits:bidLevels:` (page 3042)  
Extracts the information needed to lay out the provided glyphs from the provided range.
- `glyphRangeForCharacterRange:actualCharacterRange:` (page 3045)  
Returns the range for the glyphs mapped to the characters of the text store in the specified range.
- `setAttachmentSize:forGlyphRange:` (page 3052)  
Sets the size the specified glyphs (assumed to be attachments) will be asked to draw themselves at.
- `setBidLevels:forGlyphRange:` (page 3053)  
Sets the direction of the specified glyphs for bidirectional text.
- `setDrawsOutsideLineFragment:forGlyphRange:` (page 3054)  
Sets whether the specified glyphs exceed the bounds of the line fragment in which they are laid out.
- `setLineFragmentRect:forGlyphRange:usedRect:baselineOffset:` (page 3056)  
Sets the line fragment rectangle where the specified glyphs are laid out.

- `setLocation:withAdvancements:forStartOfGlyphRange:` (page 3056)  
Sets the location where the specified glyphs are laid out.
- `setNotShownAttribute:forGlyphRange:` (page 3057)  
Sets whether the specified glyphs are not shown.
- `insertGlyph:atGlyphIndex:characterIndex:` (page 3046) **Deprecated in Mac OS X v10.4**  
Enables the typesetter to insert a new glyph into the stream.

## Class Methods

### **defaultTypesetterBehavior**

Returns the default typesetter behavior.

```
+ (NSTypesetterBehavior)defaultTypesetterBehavior
```

#### **Return Value**

The default typesetter behavior.

#### **Discussion**

Possible return values are described in the “[Constants](#)” (page 1503) section for `NSLayoutManager`.

#### **Availability**

Available in Mac OS X v10.2 and later.

#### **Declared In**

`NSTypesetter.h`

### **printingAdjustmentInLayoutManager:forNominallySpacedGlyphRange:packedGlyphs:count:**

Returns the interglyph spacing in the specified range when sent to a printer.

```
+ (NSSize)printingAdjustmentInLayoutManager:(NSLayoutManager *)layoutMgr
 forNominallySpacedGlyphRange:(NSRange) nominallySpacedGlyphsRange
 packedGlyphs:(const unsigned char *)packedGlyphs
 count:(NSUInteger)packedGlyphsCount
```

#### **Parameters**

*layoutMgr*

The layout manager that will do the drawing.

*nominallySpacedGlyphsRange*

The range of the glyphs whose spacing is desired.

*packedGlyphs*

The glyphs as they are packed for sending to be drawn in *layoutMgr*.

*packedGlyphsCount*

The number of glyphs in *packedGlyphs*.

**Return Value**

The interglyph spacing in the specified range when sent to a printer. If the font metrics of the font used for displaying text on the screen is different from the font metrics of the font used in printing, then this interglyph spacing may need to be adjusted slightly to match that used on the screen.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSTypesetter.h`

## **sharedSystemTypesetter**

Returns a shared instance of a reentrant typesetter.

```
+ (id)sharedSystemTypesetter
```

**Return Value**

The shared system typesetter. This typesetter is reentrant.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSTypesetter.h`

## **sharedSystemTypesetterForBehavior:**

Returns a shared instance of a reentrant typesetter that implements typesetting with the specified behavior.

```
+ (id)sharedSystemTypesetterForBehavior:(NSTypesetterBehavior)theBehavior
```

**Parameters**

*theBehavior*

The desired behavior.

**Return Value**

A shared instance of a reentrant typesetter that implements typesetting with the specified behavior.

**Discussion**

Possible return values are described in the [“Constants”](#) (page 1503) section for `NSLayoutManager`.

**Availability**

Available in Mac OS X v10.2 and later.

**See Also**

- [setTypesetterBehavior:](#) (page 3058)
- [typesetterBehavior](#) (page 3061)

**Declared In**

`NSTypesetter.h`

## Instance Methods

### **actionForControlCharacterAtIndex:**

Returns the action associated with a control character.

```
- (NSTypesetterControlCharacterAction)actionForControlCharacterAtIndex:(NSUInteger)charIndex
```

#### **Parameters**

*charIndex*

The index of the control character.

#### **Return Value**

The action associated with the control character at *charIndex*.

#### **Availability**

Available in Mac OS X v10.4 and later.

#### **Declared In**

NSTypesetter.h

### **attributedString**

Returns the text backing store, usually an instance of NSTextStorage.

```
- (NSAttributedString *)attributedString
```

#### **Return Value**

The text backing store.

#### **Availability**

Available in Mac OS X v10.4 and later.

#### **See Also**

- [setAttributeString:](#) (page 3053)

#### **Declared In**

NSTypesetter.h

### **attributesForExtraLineFragment**

Returns the attributes used to lay out the extra line fragment.

```
- (NSDictionary *)attributesForExtraLineFragment
```

#### **Return Value**

A dictionary of attributes used to lay out the extra line fragment.

#### **Discussion**

The default implementation tries to use the NSTextView method [typingAttributes](#) (page 2897) if possible; otherwise, it uses the attributes for the last character.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

`NSTypesetter.h`

**baselineOffsetInLayoutManager:glyphIndex:**

Returns the distance from the bottom of the bounding box of a specified glyph to its baseline.

```
- (CGFloat)baselineOffsetInLayoutManager:(NSLayoutManager *)layoutMgr
 glyphIndex:(NSUInteger)glyphIndex
```

**Parameters**

*layoutMgr*

The layout manager used for the drawing.

*glyphIndex*

The index of the glyph in question.

**Return Value**

The distance from the bottom of the bounding box of the glyph in *layoutMgr* specified by *glyphIndex* to its baseline.

**Discussion**

The text system uses this value to calculate the vertical position of underlines.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSTypesetter.h`

**beginLineWithGlyphAtIndex:**

Sets up layout parameters at the beginning of a line during typesetting.

```
- (void)beginLineWithGlyphAtIndex:(NSUInteger)glyphIndex
```

**Parameters**

*glyphIndex*

The index of the first glyph to be laid out in the line.

**Discussion**

Concrete subclass implementations of [layoutParagraphAtPoint:](#) (page 3048) should invoke this method at the beginning of each line.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [endLineWithGlyphRange:](#) (page 3042)

**Declared In**

`NSTypesetter.h`

## beginParagraph

Sets up layout parameters at the beginning of a paragraph.

- (void)beginParagraph

### Discussion

Concrete subclasses should invoke this method at the beginning of their `layoutParagraphAtPoint:` (page 3048) implementation.

### Availability

Available in Mac OS X v10.4 and later.

### See Also

- `endParagraph` (page 3042)

### Declared In

`NSTypesetter.h`

## bidirectionalProcessingEnabled

Returns whether bidirectional text processing is enabled.

- (BOOL)bidirectionalProcessingEnabled

### Return Value

YES if bidirectional text processing is enabled, NO otherwise.

### Availability

Available in Mac OS X v10.4 and later.

### See Also

- `setBidiProcessingEnabled:` (page 3054)

### Declared In

`NSTypesetter.h`

## boundingBoxForControlGlyphAtIndex:forTextContainer:proposedLineFragment:glyphPosition:characterIndex:

Returns the bounding rectangle for the specified control glyph with the specified parameters.

```
- (NSRect)boundingBoxForControlGlyphAtIndex:(NSUInteger)glyphIndex
forTextContainer:(NSTextContainer *)textContainer
proposedLineFragment:(NSRect)proposedRect glyphPosition:(NSPoint)glyphPosition
characterIndex:(NSUInteger)charIndex
```

### Parameters

*glyphIndex*

The index of the control glyph in question.

*textContainer*

The text container to use to calculate the position.

*proposedRect*

The proposed line fragment rectangle.

*glyphPosition*

The position of the glyph in *textContainer*.

*charIndex*

The character index in *textContainer*.

#### Return Value

The bounding rectangle of the control glyph at *glyphIndex*, at the given *glyphPosition* and character index *charIndex*, in *textContainer*.

#### Discussion

The typesetter calls this method when it encounters a control glyph. The default behavior is to return zero width for control glyphs. A subclass can override this method to do something different, such as implement a way to display control characters.

`NSGlyphGenerator` can choose whether or not to map control characters to `NSControlGlyph`. Tab characters, for example, do not use this facility.

#### Availability

Available in Mac OS X v10.4 and later.

#### Declared In

`NSTypesetter.h`

## characterRangeForGlyphRange:actualGlyphRange:

Returns the range for the characters in the receiver's text store that are mapped to the specified glyphs.

```
- (NSRange)characterRangeForGlyphRange:(NSRange)glyphRange
 actualGlyphRange:(NSRangePointer)actualGlyphRange
```

#### Parameters

*glyphRange*

The range of glyphs.

*actualGlyphRange*

On return, the range of all glyphs mapped to the characters in the receiver's text store. May be `NULL`.

#### Return Value

The range for the characters in the receiver's text store that are mapped to the glyphs in *glyphRange*.

#### Discussion

A subclass can override this method to interact with custom glyph storage.

#### Availability

Available in Mac OS X v10.4 and later.

#### See Also

- [glyphRangeForCharacterRange:actualCharacterRange:](#) (page 3045)

#### Declared In

`NSTypesetter.h`

## currentParagraphStyle

Returns the paragraph style object for the text being typeset.

- (NSParagraphStyle \*)currentParagraphStyle

### Return Value

The paragraph style object for the text being typeset. This value is valid only while the typesetter is performing layout. More specifically, it's valid only when called inside [layoutGlyphsInLayoutManager:startingAtGlyphIndex:numberOfLineFragments:nextGlyphIndex:](#) (page 3047).

### Availability

Available in Mac OS X v10.4 and later.

### Declared In

NSTypesetter.h

## currentTextContainer

Returns the text container for the text being typeset.

- (NSTextContainer \*)currentTextContainer

### Return Value

The text container for the text being typeset. This value is valid only while the typesetter is performing layout. More specifically, it's valid only when called inside [layoutGlyphsInLayoutManager:startingAtGlyphIndex:numberOfLineFragments:nextGlyphIndex:](#) (page 3047).

### Availability

Available in Mac OS X v10.4 and later.

### See Also

- [textContainers](#) (page 3061)

### Declared In

NSTypesetter.h

## deleteGlyphsInRange:

Deletes the specified glyphs from the glyph cache maintained by the layout manager.

- (void)deleteGlyphsInRange:(NSRange)glyphRange

### Parameters

*glyphRange*

The range of glyphs to be deleted.

### Discussion

A subclass can override this method to interact with custom glyph storage.

### Availability

Available in Mac OS X v10.4 and later.

**See Also**

[insertGlyph:atGlyphIndex:characterIndex:](#) (page 3046)

**Declared In**

NSTypesetter.h

**endLineWithGlyphRange:**

Sets up layout parameters at the end of a line during typesetting.

- (void)endLineWithGlyphRange:(NSRange) *lineGlyphRange*

**Parameters**

*lineGlyphRange*

The range of glyphs laid out in the line.

**Discussion**

Concrete subclass implementations of [layoutParagraphAtPoint:](#) (page 3048) should invoke this method at the end of each line.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [beginLineWithGlyphAtIndex:](#) (page 3038)

**Declared In**

NSTypesetter.h

**endParagraph**

Sets up layout parameters at the end of a paragraph.

- (void)endParagraph

**Discussion**

Concrete subclasses should invoke this method at the end of their [layoutParagraphAtPoint:](#) (page 3048) implementation.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [beginParagraph](#) (page 3039)

**Declared In**

NSTypesetter.h

**getGlyphsInRange:glyphs:characterIndexes:glyphInscriptions:elasticBits:bidirectionalLevels:**

Extracts the information needed to lay out the provided glyphs from the provided range.

```
- (NSUInteger)getGlyphsInRange:(NSRange)glyphsRange glyphs:(NSGlyph *)glyphBuffer
 characterIndexes:(NSUInteger *)charIndexBuffer
 glyphInscriptions:(NSGlyphInscription *)inscribeBuffer elasticBits:(BOOL
*)elasticBuffer bidiLevels:(unsigned char *)bidiLevelBuffer
```

**Parameters***glyphsRange*

The range of glyphs.

*glyphBuffer*

The glyphs to lay out.

*charIndexBuffer*

The original characters for the glyphs. Note that a glyph at index 1 is not necessarily mapped to the character at index 1, because a glyph may be for a ligature or accent.

*inscribeBuffer*

The inscription attributes for each glyph, which are used to layout characters that are combined together.

*elasticBuffer*

Contains a Boolean value indicating whether a glyph is elastic for each glyph. An elastic glyph can be made longer at the end of a line or when needed for justification.

*bidiLevelBuffer*Contains the bidirectional level value generated by `NSGlyphGenerator`, in case a subclass chooses to use this value.**Discussion**

A subclass can override this method to interact with custom glyph storage.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**`NSTypesetter.h`**getLineFragmentRect:usedRect:forParagraphSeparatorGlyphRange:atProposedOrigin:**

Calculates the line fragment rectangle and line fragment used rectangle for blank lines.

```
- (void)getLineFragmentRect:(NSRectPointer)lineFragmentRect
 usedRect:(NSRectPointer)lineFragmentUsedRect
 forParagraphSeparatorGlyphRange:(NSRange)paragraphSeparatorGlyphRange
 atProposedOrigin:(NSPoint)lineOrigin
```

**Parameters***lineFragmentRect*

On return, the calculated line fragment rectangle.

*lineFragmentUsedRect*

On return, the used rectangle (the portion of the line fragment rectangle that actually contains marks).

*paragraphSeparatorGlyphRange*The range of glyphs under consideration. A *paragraphSeparatorGlyphRange* with length 0 indicates an extra line fragment (which occurs if the last character in the paragraph is a line separator).

*lineOrigin*

The origin point of the line fragment rectangle.

#### Availability

Available in Mac OS X v10.4 and later.

#### Declared In

NSTypesetter.h

### **getLineFragmentRect:usedRect:remainingRect:forStartingGlyphAtIndex:proposedRect:lineSpacing:paragraphSpacingBefore:paragraphSpacingAfter:**

Calculates line fragment rectangle, line fragment used rectangle, and remaining rectangle for a line fragment.

```
- (void)getLineFragmentRect:(NSRectPointer)lineFragmentRect
 usedRect:(NSRectPointer)lineFragmentUsedRect
 remainingRect:(NSRectPointer)remainingRect
 forStartingGlyphAtIndex:(NSUInteger)startingGlyphIndex
 proposedRect:(NSRect)proposedRect lineSpacing:(CGFloat)lineSpacing
 paragraphSpacingBefore:(CGFloat)paragraphSpacingBefore
 paragraphSpacingAfter:(CGFloat)paragraphSpacingAfter
```

#### Parameters

*lineFragmentRect*

On return, the calculated line fragment rectangle.

*lineFragmentUsedRect*

On return, the used rectangle (the portion of the line fragment rectangle that actually contains marks).

*remainingRect*

On return, the remaining rectangle of *proposedRect*.

*startingGlyphIndex*

The glyph index where the line fragment starts.

*proposedRect*

The proposed rectangle of the line fragment.

*lineSpacing*

The line spacing.

*paragraphSpacingBefore*

The spacing before the paragraph.

*paragraphSpacingAfter*

The spacing after the paragraph.

#### Discussion

The height of the line fragment is determined using *lineSpacing*, *paragraphSpacingBefore*, and *paragraphSpacingAfter* as well as *proposedRect*. The width for *lineFragmentUsedRect* is set to the *lineFragmentRect* width. In the standard implementation, paragraph spacing is included in the line fragment rectangle but not the line fragment used rectangle; line spacing is included in both.

#### Availability

Available in Mac OS X v10.4 and later.

#### Declared In

NSTypesetter.h

## glyphRangeForCharacterRange:actualCharacterRange:

Returns the range for the glyphs mapped to the characters of the text store in the specified range.

- (NSRange)glyphRangeForCharacterRange:(NSRange)*charRange*  
actualCharacterRange:(NSRangePointer)*actualCharRange*

### Parameters

*charRange*

The range of the characters whose glyph range is desired.

*actualCharRange*

On return, all characters mapped to those glyphs; may be NULL.

### Return Value

The range for the glyphs mapped to the characters of the text store in *charRange*.

### Discussion

A subclass can override this method to interact with custom glyph storage.

### Availability

Available in Mac OS X v10.4 and later.

### See Also

- [characterRangeForGlyphRange:actualGlyphRange:](#) (page 3040)

### Declared In

NSTypesetter.h

## hyphenationFactor

Returns the current hyphenation factor.

- (float)hyphenationFactor

### Return Value

The hyphenation factor, a value ranging from 0.0 to 1.0 that controls when hyphenation is attempted. By default, the value is 0.0, meaning hyphenation is off. A factor of 1.0 causes hyphenation to be attempted always.

### Availability

Available in Mac OS X v10.4 and later.

### See Also

- [setHyphenationFactor:](#) (page 3055)

### Declared In

NSTypesetter.h

## hyphenationFactorForGlyphAtIndex:

Returns the hyphenation factor in effect at a specified location.

- (float)hyphenationFactorForGlyphAtIndex:(NSUInteger)*glyphIndex*

**Parameters***glyphIndex*

The index of the glyph position to examine.

**Return Value**

The hyphenation factor in effect at *glyphIndex*. The hyphenation factor is a value ranging from 0.0 to 1.0 that controls when hyphenation is attempted. By default, the value is 0.0, meaning hyphenation is off. A factor of 1.0 causes hyphenation to be attempted always.

**Discussion**

The typesetter calls this method with a proposed hyphenation point for a line break to find the hyphenation factor in effect at that time. A subclass can override this method to customize the text layout process.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [hyphenCharacterForGlyphAtIndex:](#) (page 3046)

**Declared In**

`NSTypesetter.h`

**hyphenCharacterForGlyphAtIndex:**

Returns the hyphen character to be inserted after the specified glyph.

- (UTF32Char)hyphenCharacterForGlyphAtIndex:(NSUInteger)*glyphIndex*

**Parameters***glyphIndex*

The index of the glyph in question.

**Return Value**

The hyphen character to be inserted after the glyph at *glyphIndex*.

**Discussion**

The typesetter calls this method before hyphenating. A subclass can override this method to return a different hyphen glyph.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [hyphenationFactorForGlyphAtIndex:](#) (page 3045)

**Declared In**

`NSTypesetter.h`

**insertGlyph:atGlyphIndex:characterIndex:**

Enables the typesetter to insert a new glyph into the stream.

- (void)insertGlyph:(NSGlyph)*glyph* atGlyphIndex:(NSUInteger)*glyphIndex*  
characterIndex:(NSUInteger)*charIndex*

**Parameters***glyph*

The glyph to insert into the glyph cache.

*glyphIndex*

The index at which to insert *glyph*.

*charIndex*

The index of the character that *glyph* maps to. If the glyph is mapped to several characters, *charIndex* should indicate the first character to which it's mapped.

**Discussion**

The standard typesetter uses this method for inserting hyphenation glyphs. Because this method keeps the glyph caches synchronized, subclasses should always use this method to insert glyphs instead of calling [layoutManager](#) (page 3048) directly.

A subclass can override this method to interact with custom glyph storage.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

`NSTypesetter.h`

## **layoutGlyphsInLayoutManager:startingAtGlyphIndex:maximumNumberOfLineFragments:nextGlyphIndex:**

Lays out glyphs in the specified layout manager starting at a specified glyph.

```
- (void)layoutGlyphsInLayoutManager:(NSLayoutManager *)layoutMgr
 startingAtGlyphIndex:(NSUInteger)startGlyphIndex
 maximumNumberOfLineFragments:(NSUInteger)maxNumLines nextGlyphIndex:(NSUInteger)
 *)nextGlyph
```

**Parameters***layoutMgr*

The layout manager in which to lay out glyphs.

*startGlyphIndex*

The index of the starting glyph.

*maxNumLines*

The maximum number of lines to generate. Fewer lines may be laid out if the glyph storage runs out of glyphs.

*nextGlyph*

On return, set to the index of the next glyph that needs to be laid out.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSTypesetter.h`

## layoutManager

Returns the layout manager for the text being typeset.

- (NSLayoutManager \*)layoutManager

### Return Value

The layout manager for the text being typeset. This value is valid only while the typesetter is performing layout. More specifically, it's valid only when called inside

[layoutGlyphsInLayoutManager:startingAtGlyphIndex:maximumNumberOfLineFragments:nextGlyphIndex:](#) (page 3047).

### Availability

Available in Mac OS X v10.4 and later.

### Declared In

NSTypesetter.h

## layoutParagraphAtPoint:

Lays out glyphs in the current glyph range until the next paragraph separator is reached.

- (NSUInteger)layoutParagraphAtPoint:(NSPointPointer)lineFragmentOrigin

### Parameters

*lineFragmentOrigin*

The upper-left corner of line fragment rectangle. On return, *lineFragmentOrigin* contains the next origin.

### Return Value

The next glyph index; usually the index right after the paragraph separator, but it can be inside the paragraph range if, for example, the end of the text container is reached before the paragraph separator.

### Discussion

Concrete subclasses must implement this method. A concrete implementation must invoke [beginParagraph](#) (page 3039), [beginLineWithGlyphAtIndex:](#) (page 3038), [endLineWithGlyphRange:](#) (page 3042), and [endParagraph](#) (page 3042).

### Availability

Available in Mac OS X v10.4 and later.

### Declared In

NSTypesetter.h

## lineFragmentPadding

Returns the current line fragment padding, in points.

- (CGFloat)lineFragmentPadding

### Return Value

The current line fragment padding, in points; that is, the portion on each end of the line fragment rectangle left blank.

**Discussion**

Text is inset within the line fragment rectangle by this amount.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

– [setLineFragmentPadding:](#) (page 3055)

**Declared In**

`NSTypesetter.h`

**lineSpacingAfterGlyphAtIndex:withProposedLineFragmentRect:**

Returns the line spacing in effect following the specified glyph.

```
- (CGFloat)lineSpacingAfterGlyphAtIndex:(NSUInteger)glyphIndex
withProposedLineFragmentRect:(NSRect)rect
```

**Parameters**

*glyphIndex*

The index of the glyph in question.

*rect*

The proposed line fragment rectangle.

**Return Value**

the line spacing in effect following the glyph at *glyphIndex*.

**Discussion**

The `NSATSTypesetter` calls this method to determine the number of points of space to include below the descenders in the used rectangle for the proposed line fragment rectangle *rect*.

Line spacing, also called leading, is an attribute of `NSParagraphStyle`, which you can set on an `NSMutableParagraphStyle` object. A font typically includes a default minimum line spacing metric used if none is set in the paragraph style.

If the typesetter behavior specified in the layout manager is `NSTypesetterOriginalBehavior`, the text system uses the original, private typesetter `NSSimpleHorizontalTypesetter`, which adds the line spacing above the ascender. Similarly, `NSATSTypesetter` adds the line spacing above the ascender if the value is negative.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

`NSTypesetter.h`

**paragraphCharacterRange**

Returns the character range currently being processed.

```
- (NSRange)paragraphCharacterRange
```

**Return Value**

The character range currently being processed.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [paragraphSeparatorCharacterRange](#) (page 3050)
- [paragraphSeparatorGlyphRange](#) (page 3051)
- [paragraphGlyphRange](#) (page 3050)

**Declared In**

`NSTypesetter.h`

## **paragraphGlyphRange**

Returns the glyph range currently being processed.

- (`NSRange`)`paragraphGlyphRange`

**Return Value**

The glyph range currently being processed.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [setParagraphGlyphRange:separatorGlyphRange:](#) (page 3057)
- [paragraphSeparatorGlyphRange](#) (page 3051)
- [paragraphCharacterRange](#) (page 3049)
- [paragraphSeparatorCharacterRange](#) (page 3050)

**Declared In**

`NSTypesetter.h`

## **paragraphSeparatorCharacterRange**

Returns the current paragraph separator character range.

- (`NSRange`)`paragraphSeparatorCharacterRange`

**Return Value**

The current paragraph separator character range, which is the full range that contains the current character range and that extends from one paragraph separator character to the next.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [paragraphGlyphRange](#) (page 3050)
- [paragraphSeparatorGlyphRange](#) (page 3051)
- [paragraphCharacterRange](#) (page 3049)

**Declared In**

NSTypesetter.h

**paragraphSeparatorGlyphRange**

Returns the current paragraph separator range.

- (NSRange)paragraphSeparatorGlyphRange

**Return Value**

The current paragraph separator range, which is the full range that contains the current glyph range and that extends from one paragraph separator character to the next.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [setParagraphGlyphRange:separatorGlyphRange:](#) (page 3057)
- [paragraphGlyphRange](#) (page 3050)
- [paragraphSeparatorCharacterRange](#) (page 3050)
- [paragraphCharacterRange](#) (page 3049)

**Declared In**

NSTypesetter.h

**paragraphSpacingAfterGlyphAtIndex:withProposedLineFragmentRect:**

Returns the paragraph spacing that is in effect after the specified glyph.

- (CGFloat)paragraphSpacingAfterGlyphAtIndex:(NSUInteger)*glyphIndex*  
withProposedLineFragmentRect:(NSRect)*rect*

**Parameters**

*glyphIndex*

The index of the glyph in question.

*rect*

The line fragment rectangle of the last line in the paragraph.

**Return Value**

The paragraph spacing—that is, the number of points of space added following a paragraph—that is in effect after the glyph specified by *glyphIndex*.

**Discussion**

The typesetter adds the number of points specified in the return value to the bottom of the line fragment rectangle specified by *rect* (but not to the used line fragment rectangle for that line). Paragraph spacing added after a paragraph correlates to the value returned by the [paragraphSpacing](#) (page 1871) method of `NSParagraphStyle`, which you can set using the [setParagraphSpacing:](#) (page 1719) method of `NSMutableParagraphStyle`.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

– [paragraphSpacingBeforeGlyphAtIndex:withProposedLineFragmentRect:](#) (page 3052)

**Declared In**

NSTypesetter.h

**paragraphSpacingBeforeGlyphAtIndex:withProposedLineFragmentRect:**

Returns the number of points of space—added before a paragraph—that is in effect before the specified glyph.

```
- (CGFloat)paragraphSpacingBeforeGlyphAtIndex:(NSUInteger)glyphIndex
 withProposedLineFragmentRect:(NSRect)rect
```

**Parameters**

*glyphIndex*

The index of the glyph in question.

*rect*

The line fragment rectangle of the first line in the paragraph.

**Return Value**

The number of points of space—added before a paragraph—that is in effect before the glyph specified by *glyphIndex*.

**Discussion**

The typesetter adds the number of points specified in the return value to the top of the line fragment rectangle specified by *rect* (but not to the used line fragment rectangle for that line). Paragraph spacing added before a paragraph correlates to the value returned by the [paragraphSpacingBefore](#) (page 1872) method of `NSParagraphStyle`, which you can set using the [setParagraphSpacingBefore:](#) (page 1720) method of `NSMutableParagraphStyle`.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

– [paragraphSpacingAfterGlyphAtIndex:withProposedLineFragmentRect:](#) (page 3051)

**Declared In**

NSTypesetter.h

**setAttachmentSize:forGlyphRange:**

Sets the size the specified glyphs (assumed to be attachments) will be asked to draw themselves at.

```
- (void)setAttachmentSize:(NSSize)attachmentSize forGlyphRange:(NSRange)glyphRange
```

**Parameters**

*attachmentSize*

The size the glyphs in *glyphRange* (assumed to be attachments) will be asked to draw themselves at.

*glyphRange*

The range of glyphs the attachment size applies to.

**Discussion**

A subclass can override this method to interact with custom glyph storage.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

`NSTypesetter.h`

**setAttributedString:**

Sets the text backing store on which this typesetter operates.

```
- (void)setAttributedString:(NSAttributedString *)attrString
```

**Parameters**

*attrString*

The text backing store on which the typesetter should operate.

**Special Considerations**

Typesetters do not retain the text backing store on which they are operating.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [attributedString](#) (page 3037)

**Declared In**

`NSTypesetter.h`

**setBidiLevels:forGlyphRange:**

Sets the direction of the specified glyphs for bidirectional text.

```
- (void)setBidiLevels:(const uint8_t *)levels forGlyphRange:(NSRange)glyphRange
```

**Parameters**

*levels*

Values in *levels* can range from 0 to 61 as defined by Unicode Standard Annex #9.

*glyphRange*

The range of glyphs for which the bidirectional text levels are desired.

**Discussion**

A subclass can override this method to interact with custom glyph storage.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

`NSTypesetter.h`

**setBidiProcessingEnabled:**

Controls whether the typesetter performs bidirectional text processing.

```
- (void)setBidiProcessingEnabled:(BOOL)flag
```

**Parameters**

*flag*

YES to enable bidirectional text processing, NO to disable it.

**Discussion**

You can use this method to disable the bidirectional layout stage if you know the paragraph does not need this stage; that is, if the characters in the backing store are in display order.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [bidiProcessingEnabled](#) (page 3039)

**Declared In**

NSTypesetter.h

**setDrawsOutsideLineFragment:forGlyphRange:**

Sets whether the specified glyphs exceed the bounds of the line fragment in which they are laid out.

```
- (void)setDrawsOutsideLineFragment:(BOOL)flag forGlyphRange:(NSRange)glyphRange
```

**Parameters**

*flag*

YES if the glyphs in *glyphRange* exceed the bounds of the line fragment in which they are laid out, NO otherwise.

*glyphRange*

The range of the glyphs in question.

**Discussion**

This can happen when text is set at a fixed line height. For example, if the user specifies a fixed line height of 12 points and sets the font size to 24 points, the glyphs will exceed their layout rectangles.

A subclass can override this method to interact with custom glyph storage.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

NSTypesetter.h

**setHardInvalidation:forGlyphRange:**

Sets whether to force the layout manager to invalidate the specified portion of the glyph cache when invalidating layout.

```
- (void)setHardInvalidation:(BOOL)flag forGlyphRange:(NSRange)glyphRange
```

**Parameters***flag*

YES if the layout manager should invalidate the specified portion of the glyph cache, NO otherwise.

*glyphRange*

The range of glyphs in the cache to be marked for hard invalidation.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

NSTypesetter.h

**setHyphenationFactor:**

Sets the threshold controlling when hyphenation is attempted.

- (void)setHyphenationFactor:(float)*factor*

**Parameters***factor*

A frequency factor in the range of 0.0 to 1.0. By default, the value is 0.0, meaning hyphenation is off.

A *factor* of 1.0 causes hyphenation to be attempted always.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [hyphenationFactor](#) (page 3045)

**Declared In**

NSTypesetter.h

**setLineFragmentPadding:**

Sets the amount (in points) by which text is inset within line fragment rectangles.

- (void)setLineFragmentPadding:(CGFloat)*padding*

**Parameters***padding*

The amount (in points) by which text is inset within line fragment rectangles.

**Special Considerations**

Line fragment padding isn't a suitable means for expressing margins; you should set the text view's position and size for document margins or the paragraph margin attributes for text margins.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [lineFragmentPadding](#) (page 3048)

**Declared In**

NSTypesetter.h

**setLineFragmentRect:forGlyphRange:usedRect:baselineOffset:**

Sets the line fragment rectangle where the specified glyphs are laid out.

```
- (void)setLineFragmentRect:(NSRect)fragmentRect forGlyphRange:(NSRange)glyphRange
 usedRect:(NSRect)usedRect baselineOffset:(CGFloat)baselineOffset
```

**Parameters***fragmentRect*The line fragment rectangle where the glyphs in *glyphRange* are laid out.*glyphRange*

The range of the specified glyphs.

*usedRect*

The portion of *fragmentRect*, in the NSTextContainer object's coordinate system, that actually contains glyphs or other marks that are drawn (including the text container's line fragment padding). The *usedRect* must be equal to or contained within *fragmentRect*.

*baselineOffset*

The vertical distance in pixels from the line fragment origin to the baseline on which the glyphs align.

**Discussion**

The exact positions of the glyphs must be set after the line fragment rectangle with `setLocation:forStartOfGlyphRange:.`

A subclass can override this method to interact with custom glyph storage.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

NSTypesetter.h

**setLocation:withAdvancements:forStartOfGlyphRange:**

Sets the location where the specified glyphs are laid out.

```
- (void)setLocation:(NSPoint)location withAdvancements:(const CGFloat *)advancements
 forStartOfGlyphRange:(NSRange)glyphRange
```

**Parameters***location*

The location where the glyphs in *glyphRange* are laid out. The x-coordinate of *location* is expressed relative to the line fragment rectangle origin, and the y-coordinate is expressed relative to the baseline previously specified by [setLineFragmentRect:forGlyphRange:usedRect:baselineOffset:](#) (page 3056).

*advancements*

The nominal glyph advance width specified in the font metric information.

*glyphRange*

The range of glyphs whose layout location is being set. This series of glyphs can be displayed with a single PostScript `show` operation (a nominal range).

**Discussion**

Setting the location for a series of glyphs implies that the glyphs preceding it can't be included in a single `show` operation.

Before setting the location for a glyph range, you must specify line fragment rectangle with `setLineFragmentRect:forGlyphRange:usedRect:baselineOffset:.`

A subclass can override this method to interact with custom glyph storage.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

`NSTypesetter.h`

**setNotShownAttribute:forGlyphRange:**

Sets whether the specified glyphs are not shown.

```
- (void)setNotShownAttribute:(BOOL)flag forGlyphRange:(NSRange)glyphRange
```

**Parameters**

*flag*

YES if the glyphs in *glyphRange* are not shown, NO if they are shown.

*glyphRange*

The range of glyphs in question.

**Discussion**

For example, a tab or newline character doesn't leave any marks; it just indicates where following glyphs are laid out.

A subclass can override this method to interact with custom glyph storage.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

`NSTypesetter.h`

**setParagraphGlyphRange:separatorGlyphRange:**

Sets the current glyph range being processed.

```
- (void)setParagraphGlyphRange:(NSRange)paragraphRange
 separatorGlyphRange:(NSRange)paragraphSeparatorRange
```

**Parameters**

*paragraphRange*

The current glyph range being processed.

*paragraphSeparatorRange*

The range of the paragraph separator character or characters.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [paragraphGlyphRange](#) (page 3050)
- [paragraphSeparatorGlyphRange](#) (page 3051)

**Declared In**

NSTypesetter.h

**setTypesetterBehavior:**

Sets the default typesetter behavior, which affects glyph spacing and line height.

- (void)setTypesetterBehavior:(NSTypesetterBehavior)*behavior*

**Parameters**

*behavior*

The new behavior.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [typesetterBehavior](#) (page 3061)

**Declared In**

NSTypesetter.h

**setUsesFontLeading:**

Sets whether the typesetter uses the leading (or line gap) value specified in the font metric information.

- (void)setUsesFontLeading:(BOOL)*flag*

**Parameters**

*flag*

YES to use the information in the font metrics, NO to ignore it.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [usesFontLeading](#) (page 3062)

**Declared In**

NSTypesetter.h

## shouldBreakLineByHyphenatingBeforeCharacterAtIndex:

Returns whether the line being laid out should be broken by hyphenating at the specified character.

- (BOOL)shouldBreakLineByHyphenatingBeforeCharacterAtIndex:(NSUInteger)*charIndex*

### Parameters

*charIndex*

The index of the character just after the proposed hyphenation would occur.

### Return Value

YES if the line should be broken by hyphenating, NO otherwise.

### Discussion

The typesetter calls this method, if implemented by a subclass, before breaking a line by hyphenating before the character at *charIndex*, enabling the subclass to control line breaking.

A subclass can override this method to customize the text layout process. If the method returns NO, the typesetter continues looking for a break point.

### Availability

Available in Mac OS X v10.4 and later.

### See Also

- [shouldBreakLineByWordBeforeCharacterAtIndex:](#) (page 3059)

### Declared In

NSTypesetter.h

## shouldBreakLineByWordBeforeCharacterAtIndex:

Returns whether the line being laid out should be broken by a word break at the specified character.

- (BOOL)shouldBreakLineByWordBeforeCharacterAtIndex:(NSUInteger)*charIndex*

### Parameters

*charIndex*

The index of the character just after the proposed word break would occur.

### Return Value

YES if the line should be broken by a word break, NO otherwise.

### Discussion

The typesetter calls this method, if implemented by a subclass, before breaking a line by word wrapping before the character at *charIndex*, enabling the subclass to control line breaking.

A subclass can override this method to customize the text layout process. If the method returns NO, the typesetter continues looking for a break point.

### Availability

Available in Mac OS X v10.4 and later.

### See Also

- [shouldBreakLineByHyphenatingBeforeCharacterAtIndex:](#) (page 3059)

**Declared In**

NSTypesetter.h

**substituteFontForFont:**

Returns a screen font suitable for use in place of a given font.

```
- (NSFont *)substituteFontForFont:(NSFont *)originalFont
```

**Parameters***originalFont*

The original font.

**Return Value**

A screen font suitable for use in place of *originalFont*. This method returns *originalFont* if a screen font can't be used or isn't available.

**Discussion**

A screen font can only be substituted if the receiver is set to use screen fonts and if no text view associated with the receiver is scaled or rotated.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

NSTypesetter.h

**substituteGlyphsInRange:withGlyphs:**

Replaces the specified glyphs with specified replacement glyphs.

```
- (void)substituteGlyphsInRange:(NSRange)glyphRange withGlyphs:(NSGlyph *)glyphs
```

**Parameters***glyphRange*

The range of glyphs to be substituted.

*glyphs*

The glyphs to substitute for the glyphs in *glyphRange*.

**Discussion**

This method does not alter the glyph-to-character mapping or invalidate layout information.

A subclass can override this method to interact with custom glyph storage.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

NSTypesetter.h

## textContainers

Returns an array containing the text containers belonging to the current layout manager.

- (NSArray \*)textContainers

### Return Value

An array containing the text containers belonging to the current layout manager. This value is valid only while the typesetter is performing layout. More specifically, it's valid only when called inside `layoutGlyphsInLayoutManager:startingAtGlyphIndex:maximumNumberOfLineFragments:nextGlyphIndex:` (page 3047).

### Availability

Available in Mac OS X v10.4 and later.

### See Also

- `LayoutManager` (page 3048)
- `currentTextContainer` (page 3041)

### Declared In

`NSTypesetter.h`

## textTabForGlyphLocation:writingDirection:maxLocation:

Returns the text tab next closest to a given glyph location within the given parameters.

- (NSTextTab \*)textTabForGlyphLocation:(CGFloat)*glyphLocation*  
writingDirection:(NSWritingDirection)*direction* maxLocation:(CGFloat)*maxLocation*

### Parameters

*glyphLocation*

The location at which to start searching.

*direction*

The direction in which to search.

*maxLocation*

The maximum location for the search.

### Return Value

The text tab next closest to *glyphLocation*, indexing in *direction* but not beyond *maxLocation*.

### Discussion

The typesetter calls this method whenever it finds a tab character. To determine the width to advance the next glyph, the typesetter examines the `NSParagraphStyle` object's tab array and the default tab interval.

### Availability

Available in Mac OS X v10.4 and later.

### Declared In

`NSTypesetter.h`

## typesetterBehavior

Returns the current typesetter behavior.

- (NSTypesetterBehavior)typesetterBehavior

### Return Value

The current typesetter behavior.

### Availability

Available in Mac OS X v10.4 and later.

### See Also

- [setTypesetterBehavior:](#) (page 3058)

### Declared In

NSTypesetter.h

## usesFontLeading

Returns whether the typesetter uses the leading (or line gap) value specified in the font metric information of the current font.

- (BOOL)usesFontLeading

### Return Value

YES if it uses the information in the font metrics, NO otherwise.

### Availability

Available in Mac OS X v10.4 and later.

### See Also

- [setUsesFontLeading:](#) (page 3058)

### Declared In

NSTypesetter.h

## willSetLineFragmentRect:forGlyphRange:usedRect:baselineOffset:

Called by the typesetter just prior to storing the actual line fragment rectangle location in the layout manager.

```
- (void)willSetLineFragmentRect:(NSRectPointer)lineRect
 forGlyphRange:(NSRange)glyphRange usedRect:(NSRectPointer)usedRect
 baselineOffset:(CGFloat *)baselineOffset
```

### Parameters

*lineRect*

The rectangle in which the glyphs in *glyphRange* are laid out.

*glyphRange*

The range of the glyphs to lay out.

*usedRect*

The portion of *lineRect*, in the NSTextContainer object's coordinate system, that actually contains glyphs or other marks that are drawn (including the text container's line fragment padding). The *usedRect* must be equal to or contained within *lineRect*.

*baselineOffset*

The vertical distance in pixels from the line fragment origin to the baseline on which the glyphs align.

**Discussion**

Called by the typesetter just prior to calling

[setLineFragmentRect:forGlyphRange:usedRect:baselineOffset:](#) (page 3056) which stores the actual line fragment rectangle location in the layout manager.

A subclass can override this method to customize the text layout process. For example, it could change the shape of the line fragment rectangle. The subclass is responsible for ensuring that the modified rectangle remains valid (for example, that it lies within the text container).

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

`NSTypesetter.h`

## Constants

### NSTypesetterControlCharacterAction

The following constants are possible values returned by the [actionForControlCharacterAtIndex:](#) (page 3037) method to determine the action associated with a control character.

```
enum {
 NSTypesetterZeroAdvancementAction = (1 << 0),
 NSTypesetterWhitespaceAction = (1 << 1),
 NSTypesetterHorizontalTabAction = (1 << 2),
 NSTypesetterLineBreakAction = (1 << 3),
 NSTypesetterParagraphBreakAction = (1 << 4),
 NSTypesetterContainerBreakAction = (1 << 5)
};
typedef NSUInteger NSTypesetterControlCharacterAction;
```

**Constants**

`NSTypesetterZeroAdvancementAction`

Glyphs with this action are filtered out from layout (`notShownAttribute == YES`).

Available in Mac OS X v10.4 and later.

Declared in `NSTypesetter.h`.

`NSTypesetterWhitespaceAction`

The width for glyphs with this action are determined by

[boundingBoxForControlGlyphAtIndex:forTextContainer:proposedLineFragment:glyphPosition:characterIndex:](#) (page 3039), if the method is implemented; otherwise, same as `NSTypesetterZeroAdvancementAction`.

Available in Mac OS X v10.4 and later.

Declared in `NSTypesetter.h`.

`NSTypesetterHorizontalTabAction`

Treated as tab character.

Available in Mac OS X v10.4 and later.

Declared in `NSTypesetter.h`.

`NSTypesetterLineBreakAction`

Causes line break.

Available in Mac OS X v10.4 and later.

Declared in `NSTypesetter.h`.

`NSTypesetterParagraphBreakAction`

Causes paragraph break; the value returned by `firstLineHeadIndent` (page 1868) is the advancement used for the following glyph.

Available in Mac OS X v10.4 and later.

Declared in `NSTypesetter.h`.

`NSTypesetterContainerBreakAction`

Causes container break.

Available in Mac OS X v10.4 and later.

Declared in `NSTypesetter.h`.

**Declared In**

`NSTypesetter.h`

## Overview

The Application Kit extends Foundation’s NSURL class by adding support for pasteboards. `NSWorkspace` provides [openURL:](#) (page 3403) to open a location specified by a URL.

## Tasks

### Working with Pasteboards

+ [URLFromPasteboard:](#) (page 3065)

Reads an NSURL object off of *pasteboard*. Returns `nil` if *pasteboard* does not contain data of type `NSURLPboardType`.

- [writeToPasteboard:](#) (page 3066)

Writes the receiver to *pasteboard*. You must declare an `NSURLPboardType` data type for *pasteboard* before invoking this method; otherwise it returns without doing anything.

## Class Methods

### URLFromPasteboard:

Reads an NSURL object off of *pasteboard*. Returns `nil` if *pasteboard* does not contain data of type `NSURLPboardType`.

```
+ (NSURL *)URLFromPasteboard:(NSPasteboard *)pasteboard
```

#### Availability

Available in Mac OS X v10.0 and later.

**See Also**

- [writeToPasteboard:](#) (page 3066)

**Related Sample Code**

CocoaDragAndDrop

ObjectPath

QTMetadataEditor

**Declared In**

NSPasteboard.h

## Instance Methods

**writeToPasteboard:**

Writes the receiver to *pasteboard*. You must declare an `NSURLPboardType` data type for *pasteboard* before invoking this method; otherwise it returns without doing anything.

- (void)writeToPasteboard:(NSPasteboard \*)*pasteboard*

**Availability**

Available in Mac OS X v10.0 and later.

## Overview

NSUserDefaultsController is a Cocoa bindings compatible controller class. Properties of the shared instance of this class can be bound to user interface elements to access and modify values stored in NSUserDefaults.

## Tasks

### Obtaining the Shared Instance

+ [sharedUserDefaultsController](#) (page 3068)

Returns the shared instance of NSUserDefaultsController, creating it if necessary.

### Initializing a User Defaults Controller

- [initWithDefaults:initialValues:](#) (page 3070)

Returns an initialized NSUserDefaultsController object using the NSUserDefaults instance specified in *defaults* and the initial default values contained in the *initialValues* dictionary.

## Managing User Defaults Values

- `defaults` (page 3069)  
Returns the instance of NSUserDefaults in use by the receiver.
- `setInitialValues:` (page 3072)  
Sets the receiver's initial values to *initialValues*.
- `hasUnappliedChanges` (page 3069)  
Returns whether the receiver has user default values that have not been saved to NSUserDefaults.
- `initialValues` (page 3070)  
Returns a dictionary containing the receiver's initial default values.
- `setAppliesImmediately:` (page 3072)  
Sets whether any changes made to the receiver's user default properties are saved immediately.
- `appliesImmediately` (page 3069)  
Returns whether any changes made to bound user default properties are saved immediately.
- `values` (page 3072)  
Returns a key value coding compliant object that is used to access the user default properties.
- `revert:` (page 3070)  
Causes the receiver to discard any unsaved changes to bound user default properties, restoring their previous values.
- `revertToInitialValues:` (page 3071)  
Causes the receiver to discard all edits and replace the values of all the user default properties with any corresponding values in the *initialValues* (page 3070) dictionary.
- `save:` (page 3071)  
Saves the values of the receiver's user default properties.

## Class Methods

### sharedUserDefaultsController

Returns the shared instance of NSUserDefaultsController, creating it if necessary.

```
+ (id)sharedUserDefaultsController
```

#### Discussion

This instance has no initial values, and uses `[NSUserDefaults standardUserDefaults]` to create the defaults. An application can get this object when an application launches and configure it as required.

#### Availability

Available in Mac OS X v10.3 and later.

#### Related Sample Code

Dicey

#### Declared In

`NSUserDefaultsController.h`

## Instance Methods

### **appliesImmediately**

Returns whether any changes made to bound user default properties are saved immediately.

- (BOOL)appliesImmediately

#### **Discussion**

Default is YES.

This property is observable using key-value observing.

#### **Availability**

Available in Mac OS X v10.3 and later.

#### **See Also**

- [setAppliesImmediately:](#) (page 3072)

#### **Declared In**

NSUserDefaultsController.h

### **defaults**

Returns the instance of NSUserDefaults in use by the receiver.

- (NSUserDefaults \*)defaults

#### **Discussion**

This property is observable using key-value observing.

#### **Availability**

Available in Mac OS X v10.3 and later.

#### **Declared In**

NSUserDefaultsController.h

### **hasUnappliedChanges**

Returns whether the receiver has user default values that have not been saved to NSUserDefaults.

- (BOOL)hasUnappliedChanges

#### **Discussion**

This property is observable using key-value observing.

#### **Availability**

Available in Mac OS X v10.4 and later.

#### **See Also**

- [appliesImmediately](#) (page 3069)

- [setAppliesImmediately:](#) (page 3072)

**Declared In**

NSUserDefaultsController.h

**initialValues**

Returns a dictionary containing the receiver's initial default values.

- (NSDictionary \*)initialValues

**Discussion**

These values are used when is no value found for the bound property in [defaults](#) (page 3069).

This property is observable using key-value observing.

**Availability**

Available in Mac OS X v10.3 and later.

**See Also**

- [setInitialValues:](#) (page 3072)

- [revertToInitialValues:](#) (page 3071)

**Declared In**

NSUserDefaultsController.h

**initWithDefaults:initialValues:**

Returns an initialized NSUserDefaultsController object using the NSUserDefaults instance specified in *defaults* and the initial default values contained in the *initialValues* dictionary.

```
- (id)initWithDefaults:(NSUserDefaults *)defaults initialValues:(NSDictionary *)initialValues
```

**Discussion**

If *defaults* is nil, the receiver uses [NSUserDefaults standardUserDefaults].

This method is the designated initializer.

**Availability**

Available in Mac OS X v10.3 and later.

**Declared In**

NSUserDefaultsController.h

**revert:**

Causes the receiver to discard any unsaved changes to bound user default properties, restoring their previous values.

```
- (void)revert:(id)sender
```

**Discussion**

The receiver invokes [discardEditing](#) (page 3519) on any currently registered editors. The *sender* is typically the object that invoked this method.

If [appliesImmediately](#) (page 3069) is YES, this method only causes any bound editors with uncommitted changes to discard their edits.

**Availability**

Available in Mac OS X v10.3 and later.

**See Also**

- [revertToInitialValues:](#) (page 3071)

**Declared In**

NSUserDefaultsController.h

**revertToInitialValues:**

Causes the receiver to discard all edits and replace the values of all the user default properties with any corresponding values in the [initialValues](#) (page 3070) dictionary.

- (void)revertToInitialValues:(id) *sender*

**Discussion**

This effectively sets the preferences that a user can change to their “out-of-the-box” values. This method has no effect if initial values were not specified. The *sender* is typically the object that invoked this method.

**Availability**

Available in Mac OS X v10.3 and later.

**See Also**

- [initialValues](#) (page 3070)

- [revert:](#) (page 3070)

**Declared In**

NSUserDefaultsController.h

**save:**

Saves the values of the receiver’s user default properties.

- (void)save:(id) *sender*

**Discussion**

This method has no effect if [appliesImmediately](#) (page 3069) returns YES.

**Availability**

Available in Mac OS X v10.3 and later.

**Declared In**

NSUserDefaultsController.h

## setAppliesImmediately:

Sets whether any changes made to the receiver's user default properties are saved immediately.

- (void)setAppliesImmediately:(BOOL)flag

### Discussion

The default is YES.

### Availability

Available in Mac OS X v10.3 and later.

### See Also

- [appliesImmediately](#) (page 3069)

### Declared In

NSUserDefaultsController.h

## setInitialValues:

Sets the receiver's initial values to *initialValues*.

- (void)setInitialValues:(NSDictionary \*)initialValues

### Discussion

These values are used when a user default properties has no value in NSUserDefaults and by [revertToInitialValues:](#) (page 3071).

The initial values must be set before loading a nib that uses the receiver, as those values may be referenced at load time. It is good practice to set the initial values—along with registering any defaults for the applications—in the `initialize` class method of your preference dialog controller, or the application delegate.

### Availability

Available in Mac OS X v10.3 and later.

### See Also

- [defaults](#) (page 3069)

- [initialValues](#) (page 3070)

### Declared In

NSUserDefaultsController.h

## values

Returns a key value coding compliant object that is used to access the user default properties.

- (id)values

### Discussion

If present the value for the property in [defaults](#) (page 3069) is returned, otherwise a corresponding value in [initialValues](#) (page 3070) is returned.

This property is observable using key-value observing.

**Availability**

Available in Mac OS X v10.3 and later.

**Declared In**

NSUserDefaultsController.h

# NSView Class Reference

## Class at a Glance

`NSView` is a class that defines the basic drawing, event-handling, and printing architecture of an application. You typically don't interact with the `NSView` API directly; rather, your custom view classes inherit from `NSView` and override many of its methods, which are invoked automatically by the Application Kit. If you're not creating a custom view class, there are few methods you need to use.

## Principal Attributes

---

- Event handling
- Integrated display to screen and printer
- Flexible coordinate systems
- Icon dragging

## Commonly Used Methods

---

[frame](#) (page 3125)

Returns the location and size of the `NSView` object.

[bounds](#) (page 3102)

Returns the internal origin and size of the `NSView` object.

[setNeedsDisplay:](#) (page 3169)

Marks the `NSView` object as needing to be redrawn

[window](#) (page 3188)

Returns the `NSWindow` object that contains the `NSView` object.

[drawRect:](#) (page 3121)

Draws the `NSView` object. (All subclasses must implement this method, but it's rarely invoked explicitly.)

## Overview

The `NSView` class that provides a structure for drawing, printing, and handling events.

`NSView` objects (also known, simply, as view objects or views) are arranged within an `NSWindow` object, in a nested hierarchy of subviews. A view object claims a rectangular region of its enclosing superview, is responsible for all drawing within that region, and is eligible to receive mouse events occurring in it as well. In addition to these major responsibilities, `NSView` handles dragging of icons and works with the `NSScrollView` class to support efficient scrolling.

Most of the functionality of `NSView` either is automatically invoked by the Application Kit, or is available in Interface Builder. Unless you're implementing a concrete subclass of `NSView` or working intimately with the content of the view hierarchy at runtime, you don't need to know much about this class's interface. See ["Commonly Used Methods"](#) (page 3076) for methods you might use regardless.

For more information on how `NSView` instances handle event and action messages, see [Handling Events in Views](#), [Handling Mouse Events in Views](#), and [Handling Tracking-Rectangle and Cursor-Update Events in Views](#). For more information on displaying tooltips and contextual menus, see [How Contextual Menus Work and Tooltips](#).

## Subclassing Notes

---

`NSView` is perhaps the most important class in the Application Kit when it comes to subclassing and inheritance. Most user-interface objects you see in a Cocoa application are objects that inherit from `NSView`. If you want to create an object that draws itself in a special way, or that responds to mouse clicks in a special way, you would create a custom subclass of `NSView` (or of a class that inherits from `NSView`). Subclassing `NSView` is such a common and important procedure that several technical documents describe how to both draw in custom subclasses and respond to events in custom subclasses. See *Cocoa Drawing Guide* and *Cocoa Event-Handling Guide* (especially "Handling Events in Views" and "Handling Mouse Events in Views").

## Tasks

### Creating Instances

- [initWithFrame:](#) (page 3129)  
Initializes and returns a newly allocated `NSView` object with a specified frame rectangle.

### Managing the View Hierarchy

- [superview](#) (page 3177)  
Returns the receiver's superview, or `nil` if it has none.
- [setSubviews:](#) (page 3172)  
Sets the receiver's subviews to the specified subviews.
- [subviews](#) (page 3176)  
Return the receiver's immediate subviews.
- [window](#) (page 3188)  
Returns the receiver's window object, or `nil` if it has none.
- [addSubview:](#) (page 3092)  
Adds a view to the receiver's subviews so it's displayed above its siblings.
- [addSubview:positioned:relativeTo:](#) (page 3093)  
Inserts a view among the receiver's subviews so it's displayed immediately above or below another view.
- [didAddSubview:](#) (page 3113)  
Overridden by subclasses to perform additional actions when subviews are added to the receiver.
- [removeFromSuperview](#) (page 3150)  
Unlinks the receiver from its superview and its window, removes it from the responder chain, and invalidates its cursor rectangles.
- [removeFromSuperviewWithoutNeedingDisplay](#) (page 3150)  
Unlinks the receiver from its superview and its window and removes it from the responder chain, but does not invalidate its cursor rectangles to cause redrawing.
- [replaceSubview:with:](#) (page 3152)  
Replaces one of the receiver's subviews with another view.
- [isDescendantOf:](#) (page 3130)  
Returns YES if the receiver is a subview of a given view or if it's identical to that view; otherwise, it returns NO.
- [opaqueAncestor](#) (page 3141)  
Returns the receiver's closest opaque ancestor (including the receiver itself).
- [ancestorSharedWithView:](#) (page 3099)  
Returns the closest ancestor shared by the receiver and a given view.
- [sortSubviewsUsingFunction:context:](#) (page 3175)  
Orders the receiver's immediate subviews using the specified comparator function.
- [viewDidMoveToSuperview](#) (page 3182)  
Informs the receiver that its superview has changed (possibly to `nil`).

- [viewDidMoveToWindow](#) (page 3182)  
Informs the receiver that it has been added to a new view hierarchy.
- [viewWillMoveToSuperview:](#) (page 3184)  
Informs the receiver that its superview is about to change to the specified superview (which may be `nil`).
- [viewWillMoveToWindow:](#) (page 3184)  
Informs the receiver that it's being added to the view hierarchy of the specified window object (which may be `nil`).
- [willRemoveSubview:](#) (page 3188)  
Overridden by subclasses to perform additional actions before subviews are removed from the receiver.
- [enclosingMenuItem](#) (page 3123)  
Returns the menu item containing the receiver or any of its supervIEWS in the view hierarchy.

## Searching by Tag

- [viewWithTag:](#) (page 3186)  
Returns the receiver's nearest descendant (including itself) with a specific tag, or `nil` if no subview has that tag.
- [tag](#) (page 3177)  
Returns the receiver's tag, an integer that you can use to identify view objects in your application.

## Modifying the Frame Rectangle

- [setFrame:](#) (page 3164)  
Sets the receiver's frame rectangle to the specified rectangle.
- [frame](#) (page 3125)  
Returns the receiver's frame rectangle, which defines its position in its superview.
- [setFrameOrigin:](#) (page 3165)  
Sets the origin of the receiver's frame rectangle to the specified point, effectively repositioning it within its superview.
- [setFrameSize:](#) (page 3167)  
Sets the size of the receiver's frame rectangle to the specified dimensions, resizing it within its superview without affecting its coordinate system.
- [setFrameRotation:](#) (page 3166)  
Sets the rotation of the receiver's frame rectangle to a specified degree value, rotating it within its superview without affecting its coordinate system.
- [frameRotation](#) (page 3126)  
Returns the angle, in degrees, of the receiver's frame relative to its superview's coordinate system.

## Modifying the Bounds Rectangle

- [setBounds:](#) (page 3160)  
Sets the receiver's bounds rectangle.

- [bounds](#) (page 3102)  
Returns the receiver's bounds rectangle, which expresses its location and size in its own coordinate system.
- [setBoundsOrigin:](#) (page 3160)  
Sets the origin of the receiver's bounds rectangle to a specified point,
- [setBoundsSize:](#) (page 3162)  
Sets the size of the receiver's bounds rectangle to specified dimensions, inversely scaling its coordinate system relative to its frame rectangle.
- [setBoundsRotation:](#) (page 3161)  
Sets the rotation of the receiver's bounds rectangle to a specific degree value.
- [boundsRotation](#) (page 3103)  
Returns the angle, in degrees, of the receiver's bounds rectangle relative to its frame rectangle.

## Modifying the Coordinate System

- [translateOriginToPoint:](#) (page 3178)  
Translates the receiver's coordinate system so that its origin moves to a new location.
- [scaleUnitSquareToSize:](#) (page 3155)  
Scales the receiver's coordinate system so that the unit square scales to the specified dimensions.
- [rotateByAngle:](#) (page 3154)  
Rotates the receiver's bounds rectangle by a specified degree value around the origin of the coordinate system, (0.0, 0.0).

## Examining Coordinate System Modifications

- [isFlipped](#) (page 3131)  
Returns YES if the receiver uses flipped drawing coordinates or NO if it uses native coordinates.
- [isRotatedFromBase](#) (page 3133)  
Returns YES if the receiver or any of its ancestors has ever received a [setFrameRotation:](#) (page 3166) or [setBoundsRotation:](#) (page 3161) message; otherwise returns NO.
- [isRotatedOrScaledFromBase](#) (page 3133)  
Returns YES if the receiver or any of its ancestors has ever had a nonzero frame or bounds rotation, or has been scaled from the window's base coordinate system; otherwise returns NO.

## Base Coordinate Conversion

- [convertPointToBase:](#) (page 3108)  
Converts the point from the receiver's coordinate system to the base coordinate system.
- [convertPointFromBase:](#) (page 3108)  
Converts the point from the base coordinate system to the receiver's coordinate system.
- [convertSizeToBase:](#) (page 3112)  
Converts the size from the receiver's coordinate system to the base coordinate system.
- [convertSizeFromBase:](#) (page 3112)  
Converts the size from the base coordinate system to the receiver's coordinate system.

- [convertRectToBase:](#) (page 3110)  
Converts the rectangle from the receiver's coordinate system to the base coordinate system.
- [convertRectFromBase:](#) (page 3110)  
Converts the rectangle from the base coordinate system to the receiver's coordinate system.

## Converting Coordinates

- [convertPoint:fromView:](#) (page 3106)  
Converts a point from the coordinate system of a given view to that of the receiver.
- [convertPoint:toView:](#) (page 3107)  
Converts a point from the receiver's coordinate system to that of a given view.
- [convertSize:fromView:](#) (page 3110)  
Converts a size from another view's coordinate system to that of the receiver.
- [convertSize:toView:](#) (page 3111)  
Converts a size from the receiver's coordinate system to that of another view.
- [convertRect:fromView:](#) (page 3108)  
Converts a rectangle from the coordinate system of another view to that of the receiver.
- [convertRect:toView:](#) (page 3109)  
Converts a rectangle from the receiver's coordinate system to that of another view.
- [centerScanRect:](#) (page 3105)  
Converts the corners of a specified rectangle to lie on the center of device pixels, which is useful in compensating for rendering overscanning when the coordinate system has been scaled.

## Controlling Notifications

- [setPostsFrameChangedNotifications:](#) (page 3171)  
Controls whether the receiver informs observers when its frame rectangle changes.
- [postsFrameChangedNotifications](#) (page 3144)  
Returns YES if the receiver posts notifications to the default notification center whenever its frame rectangle changes; returns NO otherwise.
- [setPostsBoundsChangedNotifications:](#) (page 3170)  
Controls whether the receiver informs observers when its bounds rectangle changes.
- [postsBoundsChangedNotifications](#) (page 3143)  
Returns YES if the receiver posts notifications to the default notification center whenever its bounds rectangle changes; returns NO otherwise.

## Resizing Subviews

- [resizeSubviewsWithOldSize:](#) (page 3153)  
Informs the receiver's subviews that the receiver's bounds rectangle size has changed.
- [resizeWithOldSuperviewSize:](#) (page 3154)  
Informs the receiver that the bounds size of its superview has changed.

- [setAutoreizesSubviews:](#) (page 3158)  
Determines whether the receiver automatically resizes its subviews when its frame size changes.
- [autoreizesSubviews](#) (page 3099)  
Returns YES if the receiver automatically resizes its subviews using [resizeSubviewsWithOldSize:](#) (page 3153) whenever its frame size changes, NO otherwise.
- [setAutoreresizingMask:](#) (page 3159)  
Determines how the receiver's [resizeWithOldSuperviewSize:](#) (page 3154) method changes its frame rectangle.
- [autoreresizingMask](#) (page 3100)  
Returns the receiver's autoreresizing mask, which determines how it's resized by the [resizeWithOldSuperviewSize:](#) (page 3154) method.

## Focusing

- [lockFocus](#) (page 3135)  
Locks the focus on the receiver, so subsequent commands take effect in the receiver's window and coordinate system.
- [lockFocusIfCanDraw](#) (page 3136)  
Locks the focus to the receiver atomically if the `canDraw` method returns YES and returns the value of `canDraw`.
- [lockFocusIfCanDrawInContext:](#) (page 3136)  
Locks the focus to the receiver atomically if drawing can occur in the specified graphics context.
- [unlockFocus](#) (page 3180)  
Balances an earlier [lockFocus](#) (page 3135) or [lockFocusIfCanDraw](#) (page 3136) message; restoring the focus to the previously focused view is necessary.
- + [focusView](#) (page 3091)  
Returns the currently focused `NSView` object, or `nil` if there is none.

## Displaying

- [setNeedsDisplay:](#) (page 3169)  
Controls whether the receiver's entire bounds is marked as needing display.
- [setNeedsDisplayInRect:](#) (page 3169)  
Marks the region of the receiver within the specified rectangle as needing display, increasing the receiver's existing invalid region to include it.
- [needsDisplay](#) (page 3139)  
Returns YES if the receiver needs to be displayed, as indicated using [setNeedsDisplay:](#) (page 3169) and [setNeedsDisplayInRect:](#) (page 3169); returns NO otherwise.
- [display](#) (page 3114)  
Displays the receiver and all its subviews if possible, invoking each the `NSView` methods [lockFocus](#) (page 3135), [drawRect:](#) (page 3121), and [unlockFocus](#) (page 3180) as necessary.
- [displayRect:](#) (page 3116)  
Acts as [display](#) (page 3114), but confining drawing to a rectangular region of the receiver.

- [displayRectIgnoringOpacity:](#) (page 3116)  
Displays the receiver but confines drawing to a specified region and does not back up to the first opaque ancestor—it simply causes the receiver and its descendants to execute their drawing code.
- [displayRectIgnoringOpacity:inContext:](#) (page 3117)  
Causes the receiver and its descendants to be redrawn to the specified graphics context.
- [displayIfNeeded](#) (page 3115)  
Displays the receiver and all its subviews if any part of the receiver has been marked as needing display with a [setNeedsDisplay:](#) (page 3169) or [setNeedsDisplayInRect:](#) (page 3169) message.
- [displayIfNeededInRect:](#) (page 3115)  
Acts as [displayIfNeeded](#) (page 3115), confining drawing to a specified region of the receiver..
- [displayIfNeededIgnoringOpacity](#) (page 3115)  
Acts as [displayIfNeeded](#) (page 3115), except that this method doesn't back up to the first opaque ancestor—it simply causes the receiver and its descendants to execute their drawing code.
- [displayIfNeededInRectIgnoringOpacity:](#) (page 3116)  
Acts as [displayIfNeeded](#) (page 3115), but confining drawing to *aRect* and not backing up to the first opaque ancestor—it simply causes the receiver and its descendants to execute their drawing code.
- [translateRectsNeedingDisplayInRect:by:](#) (page 3179)  
Translates the display rectangles by the specified delta.
- [isOpaque](#) (page 3132)  
Overridden by subclasses to return YES if the receiver is opaque, NO otherwise.
- [viewWillDraw](#) (page 3183)  
Informs the receiver that it will be required to draw content.

## Focus Ring Drawing

- [setKeyboardFocusRingNeedsDisplayInRect:](#) (page 3168)  
Invalidates the area around the focus ring.
- + [defaultFocusRingType](#) (page 3090)  
Returns the default focus ring type.
- [setFocusRingType:](#) (page 3164)  
Sets the type of focus ring to be drawn around the receiver.
- [focusRingType](#) (page 3125)  
Returns the type of focus ring drawn around the receiver.

## Fullscreen Mode

- [enterFullscreenMode:withOptions:](#) (page 3124)  
Sets the receiver to full screen mode.
- [exitFullscreenModeWithOptions:](#) (page 3124)  
Instructs the receiver to exit full screen mode.
- [isInFullscreenMode](#) (page 3132)  
Returns a Boolean value that indicates whether the receiver is in full screen mode.

## Hiding Views

- [setHidden:](#) (page 3167)  
Sets whether the receiver is hidden.
- [isHidden](#) (page 3131)  
Returns whether the receiver is marked as hidden.
- [isHiddenOrHasHiddenAncestor](#) (page 3132)  
Returns YES if the receiver is marked as hidden or has an ancestor in the view hierarchy that is marked as hidden; returns NO otherwise.
- [viewDidHide](#) (page 3182)  
Invoked when the receiver is hidden, either directly, or in response to an ancestor being hidden.
- [viewDidUnhide](#) (page 3183)  
Invoked when the receiver is unhidden, either directly, or in response to an ancestor being unhidden.

## Drawing

- [drawRect:](#) (page 3121)  
Overridden by subclasses to draw the receiver's image within the passed-in rectangle.
- [visibleRect](#) (page 3186)  
Returns the portion of the receiver not clipped by its superviews.
- [canDraw](#) (page 3105)  
Returns YES if drawing commands will produce any result, NO otherwise.
- [shouldDrawColor](#) (page 3175)  
Returns NO if the receiver is being drawn in an `NSWindow` object (as opposed, for example, to being printed) and the window object can't store color; otherwise returns YES.
- [getRectsBeingDrawn:count:](#) (page 3126)  
Returns by indirection a list of non-overlapping rectangles that define the area the receiver is being asked to draw in [drawRect:](#) (page 3121).
- [needsToDrawRect:](#) (page 3139)  
Returns whether the specified rectangle intersects any part of the area that the receiver is being asked to draw.
- [wantsDefaultClipping](#) (page 3187)  
Returns whether the Application Kit's default clipping provided to [drawRect:](#) (page 3121) implementations is in effect.
- [bitmapImageRepForCachingDisplayInRect:](#) (page 3102)  
Returns a bitmap-representation object suitable for caching the specified portion of the receiver.
- [cacheDisplayInRect:toBitmapImageRep:](#) (page 3104)  
Draws the specified area of the receiver, and its descendants, into a provided bitmap-representation object.

## Managing Live Resize

- [inLiveResize](#) (page 3130)  
A convenience method, expected to be called from [drawRect:](#) (page 3121), to assist in decisions about optimized drawing.

- [preservesContentDuringLiveResize](#) (page 3144)  
Returns YES if the view supports the optimization of live-resize operations by preserving content that has not moved; otherwise, returns NO.
- [getRectsExposedDuringLiveResize:count:](#) (page 3127)  
Returns a list of rectangles indicating the newly exposed areas of the receiver.
- [rectPreservedDuringLiveResize](#) (page 3147)  
Returns the rectangle identifying the portion of your view that did not change during a live resize operation.
- [viewWillStartLiveResize](#) (page 3185)  
Informs the receiver of the start of a live resize.
- [viewDidEndLiveResize](#) (page 3181)  
Informs the receiver of the end of a live resize.

## Managing the Graphics State

- [allocateGState](#) (page 3098)  
Causes the receiver to maintain a private graphics state object, which encapsulates all parameters of the graphics environment.
- [gState](#) (page 3128)  
Returns the identifier for the receiver's graphics state object, or 0 if the receiver doesn't have a graphics state object.
- [setUpGState](#) (page 3173)  
Overridden by subclasses to (re)initialize the receiver's graphics state object.
- [renewGState](#) (page 3152)  
Invalidates the receiver's graphics state object, if it has one.
- [releaseGState](#) (page 3149)  
Frees the receiver's graphics state object, if it has one.

## Event Handling

- [acceptsFirstMouse:](#) (page 3091)  
Overridden by subclasses to return YES if the receiver should be sent a [mouseDown:](#) (page 2133) message for an initial mouse-down event, NO if not.
- [hitTest:](#) (page 3129)  
Returns the farthest descendant of the receiver in the view hierarchy (including itself) that contains a specified point, or nil if that point lies completely outside the receiver.
- [mouse:inRect:](#) (page 3137)  
Returns whether a region of the receiver contains a specified point, accounting for whether the receiver is flipped or not.
- [performKeyEquivalent:](#) (page 3142)  
Implemented by subclasses to respond to key equivalents (also known as keyboard shortcuts).
- [performMnemonic:](#) (page 3143)  
Implemented by subclasses to respond to mnemonics.

- [mouseDownCanMoveWindow](#) (page 3138)  
Returns YES if the receiver does not need to handle a mouse down and can pass it through to superviews; NO if it needs to handle the mouse down.

## Dragging Operations

- [dragImage:at:offset:event:pasteboard:source:slideBack:](#) (page 3118)  
Initiates a dragging operation from the receiver, allowing the user to drag arbitrary data with a specified icon into any application that has window or view objects that accept dragged data.
- [dragFile:fromRect:slideBack:event:](#) (page 3117)  
Initiates a dragging operation from the receiver, allowing the user to drag a file icon to any application that has window or view objects that accept files.
- [registerForDraggedTypes:](#) (page 3148)  
Registers the pasteboard types that the receiver will accept as the destination of an image-dragging session.
- [registeredDraggedTypes](#) (page 3148)  
Returns the array of pasteboard drag types that the view can accept.
- [unregisterDraggedTypes](#) (page 3180)  
Unregisters the receiver as a possible destination in a dragging session.
- [shouldDelayWindowOrderingForEvent:](#) (page 3174)  
Overridden by subclasses to allow the user to drag images from the receiver without its window moving forward and possibly obscuring the destination and without activating the application.
- [dragPromisedFilesOfTypes:fromRect:source:slideBack:event:](#) (page 3120)  
Initiates a dragging operation from the receiver, allowing the user to drag one or more promised files (or directories) into any application that has window or view objects that accept promised file data.

## Tool Tips

- [addToolTipRect:owner:userData:](#) (page 3094)  
Creates a tool tip for a defined area the receiver and returns a tag that identifies the tool tip rectangle.
- [removeAllToolTips](#) (page 3149)  
Removes all tool tips assigned to the receiver.
- [removeToolTip:](#) (page 3151)  
Removes the tool tip identified by specified tag.
- [setToolTip:](#) (page 3173)  
Sets the tool tip text for the view to *string*.
- [toolTip](#) (page 3178)  
Returns the text for the view's tool tip.

## Managing Tracking Rectangles

- [addTrackingRect:owner:userData:assumeInside:](#) (page 3095)  
Establishes an area for tracking mouse-entered and mouse-exited events within the receiver and returns a tag that identifies the tracking rectangle.

- [removeTrackingRect:](#) (page 3151)  
Removes the tracking rectangle identified by a tag.

## Managing Tracking Areas

- [addTrackingArea:](#) (page 3094)  
Adds a given tracking area to the receiver.
- [removeTrackingArea:](#) (page 3151)  
Removes a given tracking area from the receiver.
- [trackingAreas](#) (page 3178)  
Returns an array of the receiver's tracking areas.
- [updateTrackingAreas](#) (page 3181)  
Invoked automatically when the view's geometry changes such that its tracking areas need to be recalculated.

## Managing Cursor Tracking

- [addCursorRect:cursor:](#) (page 3092)  
Establishes the cursor to be used when the mouse pointer lies within a specified region.
- [removeCursorRect:cursor:](#) (page 3149)  
Completely removes a cursor rectangle from the receiver.
- [discardCursorRects](#) (page 3114)  
Invalidates all cursor rectangles set up using [addCursorRect:cursor:](#) (page 3092).
- [resetCursorRects](#) (page 3153)  
Overridden by subclasses to define their default cursor rectangles.

## Scrolling

- [scrollPoint:](#) (page 3156)  
Scrolls the receiver's closest ancestor `NSClipView` object so a point in the receiver lies at the origin of the clip view's bounds rectangle.
- [scrollRectToVisible:](#) (page 3157)  
Scrolls the receiver's closest ancestor `NSClipView` object the minimum distance needed so a specified region of the receiver becomes visible in the clip view.
- [autoscroll:](#) (page 3100)  
Scrolls the receiver's closest ancestor `NSClipView` object proportionally to the distance of an event that occurs outside of it.
- [adjustScroll:](#) (page 3097)  
Overridden by subclasses to modify a given rectangle, returning the altered rectangle.
- [scrollRect:by:](#) (page 3156)  
Copies the visible portion of the receiver's rendered image within a region and lays that portion down again at a specified offset .

- [enclosingScrollView](#) (page 3123)  
Returns the nearest ancestor `NSScrollView` object containing the receiver (not including the receiver itself); otherwise returns `nil`.
- [scrollViewClipView:toPoint:](#) (page 3155)  
Notifies the superview of a clip view that the clip view needs to reset the origin of its bounds rectangle.
- [reflectScrolledClipView:](#) (page 3147)  
Notifies a clip view's superview that either the clip view's bounds rectangle or the document view's frame rectangle has changed, and that any indicators of the scroll position need to be adjusted.

## Contextual Menus

- [menuForEvent:](#) (page 3137)  
Overridden by subclasses to return a context-sensitive pop-up menu for a given mouse-down event.
- + [defaultMenu](#) (page 3090)  
Overridden by subclasses to return the default pop-up menu for instances of the receiving class.

## Key-view Loop Management

- [canBecomeKeyView](#) (page 3104)  
Returns `YES` if the receiver can become key view, `NO` otherwise.
- [needsPanelToBecomeKey](#) (page 3139)  
Overridden by subclasses to return `YES` if the receiver requires its panel, which might otherwise avoid becoming key, to become the key window so that it can handle keyboard input.
- [setNextKeyView:](#) (page 3170)  
Inserts a specified view object after the receiver in the key view loop of the receiver's window.
- [nextKeyView](#) (page 3140)  
Returns the view object following the receiver in the key view loop, or `nil` if there is none.
- [nextValidKeyView](#) (page 3140)  
Returns the closest view object in the key view loop that follows the receiver and actually accepts first responder status, or `nil` if there is none.
- [previousKeyView](#) (page 3144)  
Returns the view object preceding the receiver in the key view loop, or `nil` if there is none.
- [previousValidKeyView](#) (page 3145)  
Returns the closest view object in the key view loop that precedes the receiver and actually accepts first responder status, or `nil` if there is none.

## Printing

- [print:](#) (page 3145)  
This action method opens the Print panel, and if the user chooses an option other than canceling, prints the receiver and all its subviews to the device specified in the Print panel.
- [beginPageInRect:atPlacement:](#) (page 3101)  
Called at the beginning of each page, this method sets up the coordinate system so that a region inside the receiver's bounds is translated to a specified location..

- [dataWithEPSInsideRect:](#) (page 3112)  
Returns EPS data that draws the region of the receiver within a specified rectangle.
- [dataWithPDFInsideRect:](#) (page 3113)  
Returns PDF data that draws the region of the receiver within a specified rectangle.
- [printJobTitle](#) (page 3146)  
Returns the receiver's print job title.
- [pageFooter](#) (page 3141)  
Returns a default footer string that includes the current page number and page count.
- [pageHeader](#) (page 3142)  
Returns a default header string that includes the print job title and date.
- [writeEPSInsideRect:toPasteboard:](#) (page 3189)  
Writes EPS data that draws the region of the receiver within a specified rectangle onto a pasteboard.
- [writePDFInsideRect:toPasteboard:](#) (page 3189)  
Writes PDF data that draws the region of the receiver within a specified rectangle onto a pasteboard.
- [drawPageBorderWithSize:](#) (page 3121)  
Allows applications that use the Application Kit pagination facility to draw additional marks on each logical page.
- [drawSheetBorderWithSize:](#) (page 3122)  
Allows applications that use the Application Kit pagination facility to draw additional marks on each printed sheet.

## Pagination

- [heightAdjustLimit](#) (page 3128)  
Returns the fraction (from 0.0 to 1.0) of the page that can be pushed onto the next page during automatic pagination to prevent items such as lines of text from being divided across pages.
- [widthAdjustLimit](#) (page 3187)  
Returns the fraction (from 0.0 to 1.0) of the page that can be pushed onto the next page during automatic pagination to prevent items such as small images or text columns from being divided across pages.
- [adjustPageWidthNew:left:right:limit:](#) (page 3097)  
Overridden by subclasses to adjust page width during automatic pagination.
- [adjustPageHeightNew:top:bottom:limit:](#) (page 3096)  
Overridden by subclasses to adjust page height during automatic pagination.
- [knowsPageRange:](#) (page 3134)  
Returns YES if the receiver handles page boundaries, NO otherwise.
- [rectForPage:](#) (page 3146)  
Implemented by subclasses to determine the portion of the receiver to be printed for the page number page.
- [locationOfPrintRect:](#) (page 3135)  
Invoked by [print:](#) (page 3145) to determine the location of the region of the receiver being printed on the physical page.

## Writing Conforming Rendering Instructions

- `beginDocument` (page 3101)  
Invoked at the beginning of the printing session, this method sets up the current graphics context.
- `endDocument` (page 3123)  
This method is invoked at the end of the printing session.
- `endPage` (page 3124)  
Writes the end of a conforming page.

## Core Animation Layer-Backing

- `setLayer:` (page 3168)  
Sets the Core Animation layer that the receiver uses for layer-backing to the specified layer.
- `layer` (page 3134)  
Returns the Core Animation layer that the receiver as its backing store.
- `setWantsLayer:` (page 3174)  
Specifes whether the receiver and its subviews use a Core Animation layer as a backing store.
- `wantsLayer` (page 3187)  
Returns a Boolean value that indicates whether the receiver is using a layer as it's backing store.

## Core Animation Layer Properties

- `setFrameCenterRotation:` (page 3165)  
Rotates the frame of the receiver about the layer's position.
- `frameCenterRotation` (page 3126)  
Returns the receiver's rotation about the layer's position.
- `setAlphaValue:` (page 3158)  
Sets the opacity of the receiver.
- `alphaValue` (page 3098)  
Returns the opacity of the receiver
- `setBackgroundFilters:` (page 3159)  
An array of CoreImage filters that are applied to the receiver's background.
- `backgroundFilters` (page 3101)  
Returns the array of CoreImage filters that are applied to the receiver's background
- `setCompositingFilter:` (page 3163)  
Sets a CoreImage filter that is used to composite the receiver's contents with the background.
- `compositingFilter` (page 3106)  
Returns the CoreImage filter that is used to composite the receiver's contents with the background
- `setContentFilters:` (page 3163)  
Sets the array of CoreImage filters that are applied to the contents of the receiver and its sublayers.
- `contentFilters` (page 3106)  
Returns the array of CoreImage filters that are applied to the contents of the receiver and its sublayers.

- [setShadow:](#) (page 3172)  
Sets the shadow drawn by the receiver.
- [shadow](#) (page 3174)  
Returns the shadow drawn by the receiver

## Class Methods

### defaultFocusRingType

Returns the default focus ring type.

```
+ (NSFocusRingType)defaultFocusRingType
```

#### Return Value

The default type of focus ring for objects of the receiver's class. Possible return values are listed in [NSFocusRingType](#) (page 3705).

#### Discussion

If `NSFocusRingTypeDefault` is returned from the instance method [focusRingType](#) (page 3125), the receiver can invoke this class method to find out what type of focus ring is the default. The receiver is free to ignore the default setting.

#### Availability

Available in Mac OS X v10.3 and later.

#### Declared In

NSView.h

### defaultMenu

Overridden by subclasses to return the default pop-up menu for instances of the receiving class.

```
+ (NSMenu *)defaultMenu
```

#### Discussion

The default implementation returns `nil`.

#### Availability

Available in Mac OS X v10.0 and later.

#### See Also

- [menuForEvent:](#) (page 3137)
- [menu](#) (page 2133) (NSResponder)

#### Declared In

NSView.h

## focusView

Returns the currently focused `NSView` object, or `nil` if there is none.

```
+ (NSView *)focusView
```

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [lockFocus](#) (page 3135)
- [unlockFocus](#) (page 3180)

### Declared In

`NSView.h`

## Instance Methods

### acceptsFirstMouse:

Overridden by subclasses to return YES if the receiver should be sent a [mouseDown:](#) (page 2133) message for an initial mouse-down event, NO if not.

```
- (BOOL)acceptsFirstMouse:(NSEvent *)theEvent
```

### Parameters

*theEvent*

The initial mouse-down event, which must be over the receiver in its window.

### Discussion

The receiver can either return a value unconditionally or use the location of *theEvent* to determine whether or not it wants the event. The default implementation ignores *theEvent* and returns NO.

Override this method in a subclass to allow instances to respond to click-through. This allows the user to click on a view in an inactive window, activating the view with one click, instead of clicking first to make the window active and then clicking the view. Most view objects refuse a click-through attempt, so the event simply activates the window. Many control objects, however, such as instances of `NSButton` and `NSSlider`, do accept them, so the user can immediately manipulate the control without having to release the mouse button.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [hitTest:](#) (page 3129)

### Declared In

`NSView.h`

## addCursorRect:cursor:

Establishes the cursor to be used when the mouse pointer lies within a specified region.

```
- (void)addCursorRect:(NSRect)aRect cursor:(NSCursor *)aCursor
```

### Parameters

*aRect*

A rectangle defining a region of the receiver.

*aCursor*

An object representing a cursor.

### Discussion

Cursor rectangles aren't subject to clipping by superviews, nor are they intended for use with rotated views. You should explicitly confine a cursor rectangle to the view's visible rectangle to prevent improper behavior.

This method is intended to be invoked only by the [resetCursorRects](#) (page 3153) method. If invoked in any other way, the resulting cursor rectangle will be discarded the next time the view's cursor rectangles are rebuilt.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [removeCursorRect:cursor:](#) (page 3149)
- [discardCursorRects](#) (page 3114)
- [resetCursorRects](#) (page 3153)
- [visibleRect](#) (page 3186)

### Declared In

NSView.h

## addSubview:

Adds a view to the receiver's subviews so it's displayed above its siblings.

```
- (void)addSubview:(NSView *)aView
```

### Parameters

*aView*

The view to add to the receiver as a subview.

### Discussion

This method also sets the receiver as the next responder of *aView*.

The receiver retains *aView*. If you use [removeFromSuperview](#) (page 3150) to remove *aView* from the view hierarchy, *aView* is released. If you want to keep using *aView* after removing it from the view hierarchy (if, for example, you are swapping through a number of views), you must retain it before invoking [removeFromSuperview](#) (page 3150).

### Availability

Available in Mac OS X v10.0 and later.

**See Also**

- [addSubview:positioned:relativeTo:](#) (page 3093)
- [subviews](#) (page 3176)
- [removeFromSuperview](#) (page 3150)
- [setNextResponder:](#) (page 2160) (NSResponder)
- [viewWillMoveToSuperview:](#) (page 3184)
- [viewWillMoveToWindow:](#) (page 3184)

**Related Sample Code**

iSpend

Quartz Composer WWDC 2005 TextEdit

Sketch-112

TextEditPlus

WhackedTV

**Declared In**

NSView.h

**addSubview:positioned:relativeTo:**

Inserts a view among the receiver's subviews so it's displayed immediately above or below another view.

```
- (void)addSubview:(NSView *)aView positioned:(NSWindowOrderingMode)place
 relativeTo:(NSView *)otherView
```

**Parameters***aView*

The view object to add to the receiver as a subview.

*place*

An enum constant specifying the position of the *aView* relative to *otherView*. Valid values are `NSWindowAbove` or `NSWindowBelow`.

*otherView*

The other view *aView* is to be positioned relative to. If *otherView* is `nil` (or isn't a subview of the receiver), *aView* is added above or below all of its new siblings.

**Discussion**

This method also sets the receiver as the next responder of *aView*.

The receiver retains *aView*. If you use [removeFromSuperview](#) (page 3150) to remove *aView* from the view hierarchy, *aView* is released. If you want to keep using *aView* after removing it from the view hierarchy (if, for example, you are swapping through a number of views), you must retain it before invoking [removeFromSuperview](#) (page 3150).

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [addSubview:](#) (page 3092)
- [subviews](#) (page 3176)
- [removeFromSuperview](#) (page 3150)
- [setNextResponder:](#) (page 2160) (NSResponder)

**Declared In**  
NSView.h

## addToolTipRect:owner:userData:

Creates a tool tip for a defined area the receiver and returns a tag that identifies the tool tip rectangle.

```
- (NSToolTipTag)addToolTipRect:(NSRect)aRect owner:(id)anObject userData:(void *)userData
```

### Parameters

*aRect*

A rectangle defining the region of the receiver to associate the tool tip with.

*anObject*

An object from which to obtain the tool tip string. The object should either implement [view:stringForToolTip:point:userData:](#) (page 3633), or return a suitable string from its `description` method. (It can therefore simply be an `NSString` object.)

**Important:** The receiver maintains a weak reference to *anObject*. You are responsible for ensuring that *anObject* remains valid for as long as it may be needed.

*userData*

Any additional information you want to pass to [view:stringForToolTip:point:userData:](#) (page 3633); it is not used if *anObject* does not implement this method.

### Return Value

An integer tag identifying the tool tip; you can use this tag to remove the tool tip.

### Discussion

The tool tip string is obtained dynamically from *anObject* by invoking either the `NSToolTipOwner` informal protocol method [view:stringForToolTip:point:userData:](#) (page 3633), if implemented, or the `NSObject` protocol method `description`.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [removeToolTip:](#) (page 3151)
- [removeAllToolTips](#) (page 3149)

**Declared In**  
NSView.h

## addTrackingArea:

Adds a given tracking area to the receiver.

```
- (void)addTrackingArea:(NSTrackingArea *)trackingArea
```

**Parameters***trackingArea*

The tracking area to add to the receiver.

**Availability**

Available in Mac OS X v10.5 and later.

**Related Sample Code**

BasicCocoaAnimations

**Declared In**

NSView.h

**addTrackingRect:owner:userData:assumeInside:**

Establishes an area for tracking mouse-entered and mouse-exited events within the receiver and returns a tag that identifies the tracking rectangle.

```
- (NSTrackingRectTag)addTrackingRect:(NSRect)aRect owner:(id)userObject
 userData:(void *)userData assumeInside:(BOOL)flag
```

**Parameters***aRect*

A rectangle that defines a region of the receiver for tracking mouse-entered and mouse-exited events.

*userObject*

The object that gets sent the event messages. It can be the receiver itself or some other object (such as an `NSCursor` or a custom drawing tool object), as long as it responds to both `mouseEntered:` (page 2134) and `mouseExited:` (page 2134).

*userData*Data stored in the `NSEvent` object for each tracking event.*flag*

If YES, the first event will be generated when the cursor leaves *aRect*, regardless if the cursor is inside *aRect* when the tracking rectangle is added. If NO the first event will be generated when the cursor leaves *aRect* if the cursor is initially inside *aRect*, or when the cursor enters *aRect* if the cursor is initially outside *aRect*. You usually want to set this flag to NO.

**Return Value**

A tag that identifies the tracking rectangle. It is stored in the associated `NSEvent` objects and can be used to remove the tracking rectangle.

**Discussion**

Tracking rectangles provide a general mechanism that can be used to trigger actions based on the cursor location (for example, a status bar or hint field that provides information on the item the cursor lies over). To simply change the cursor over a particular area, use `addCursorRect:cursor:` (page 3092). If you must use tracking rectangles to change the cursor, the `NSCursor` class specification describes the additional methods that must be invoked to change cursors by using tracking rectangles.

On Mac OS X v10.5 and later, tracking areas provide a greater range of functionality (see `addTrackingArea:` (page 3094)).

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [removeTrackingRect:](#) (page 3151)
- [addTrackingArea:](#) (page 3094)
- [userData](#) (page 1081) (NSEvent)

**Related Sample Code**

FunkyOverlayWindow

**Declared In**

NSView.h

**adjustPageHeightNew:top:bottom:limit:**

Overridden by subclasses to adjust page height during automatic pagination.

```
- (void)adjustPageHeightNew:(CGFloat *)newBottom top:(CGFloat)top
 bottom:(CGFloat)proposedBottom limit:(CGFloat)bottomLimit
```

**Parameters***newBottom*

Returns by indirection a new `float` value for the bottom edge of the pending page rectangle in the receiver's coordinate system.

*top*

A `float` value that sets the top edge of the pending page rectangle in the receiver's coordinate system.

*proposedBottom*

A `float` value that sets the bottom edge of the pending page rectangle in the receiver's coordinate system.

*bottomLimit*

The topmost `float` value *newBottom* can be set to, as calculated using the return value of [heightAdjustLimit](#) (page 3128).

**Discussion**

This method is invoked by [print:](#) (page 3145). The receiver can raise the bottom edge and return the new value in *newBottom*, allowing it to prevent items such as lines of text from being divided across pages. If *bottomLimit* is exceeded, the pagination mechanism simply uses *bottomLimit* for the bottom edge.

The default implementation of this method propagates the message to its subviews, allowing nested views to adjust page height for their drawing as well. An `NSButton` object or other small view, for example, will nudge the bottom edge up if necessary to prevent itself from being cut in two (thereby pushing it onto an adjacent page). Subclasses should invoke `super`'s implementation, if desired, after first making their own adjustments.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [adjustPageWidthNew:left:right:limit:](#) (page 3097)

**Declared In**

NSView.h

## adjustPageWidthNew:left:right:limit:

Overridden by subclasses to adjust page width during automatic pagination.

```
- (void)adjustPageWidthNew:(CGFloat *)newRight left:(CGFloat)left
 right:(CGFloat)proposedRight limit:(CGFloat)rightLimit
```

### Parameters

*newRight*

Returns by indirection a new `float` value for the right edge of the pending page rectangle in the receiver's coordinate system.

*left*

A `float` value that sets the left edge of the pending page rectangle in the receiver's coordinate system.

*proposedRight*

A `float` value that sets the right edge of the pending page rectangle in the receiver's coordinate system.

*rightLimit*

The leftmost `float` value *newRight* can be set to, as calculated using the return value of [widthAdjustLimit](#) (page 3187).

### Discussion

This method is invoked by [print:](#) (page 3145). The receiver can pull in the right edge and return the new value in *newRight*, allowing it to prevent items such as small images or text columns from being divided across pages. If *rightLimit* is exceeded, the pagination mechanism simply uses *rightLimit* for the right edge.

The default implementation of this method propagates the message to its subviews, allowing nested views to adjust page width for their drawing as well. An `NSButton` object or other small view, for example, will nudge the right edge out if necessary to prevent itself from being cut in two (thereby pushing it onto an adjacent page). Subclasses should invoke `super`'s implementation, if desired, after first making their own adjustments.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [adjustPageHeightNew:top:bottom:limit:](#) (page 3096)

### Declared In

`NSView.h`

## adjustScroll:

Overridden by subclasses to modify a given rectangle, returning the altered rectangle.

```
- (NSRect)adjustScroll:(NSRect)proposedVisibleRect
```

### Parameters

*proposedVisibleRect*

A rectangle defining a region of the receiver.

**Discussion**

`NSClipView` invokes this method to allow its document view to adjust its position during scrolling. For example, a custom view object that displays a table of data can adjust the origin of *proposedVisibleRect* so rows or columns aren't cut off by the edge of the enclosing `NSClipView`. `NSView`'s implementation simply returns *proposedVisibleRect*.

`NSClipView` only invokes this method during automatic or user controlled scrolling. Its `scrollToPoint:` (page 637) method doesn't invoke this method, so you can still force a scroll to an arbitrary point.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSView.h`

## **allocateGState**

Causes the receiver to maintain a private graphics state object, which encapsulates all parameters of the graphics environment.

- (void)allocateGState

**Discussion**

If you do not invoke `allocateGState`, a graphics state object is constructed from scratch each time the `NSView` is focused.

The receiver builds the graphics state parameters using `setUpGState` (page 3173), then automatically establishes this graphics state each time the focus is locked on it. A graphics state may improve performance for view objects that are focused often and need to set many parameters, but use of standard rendering operators is normally efficient enough.

Because graphics states occupy a fair amount of memory, they can actually degrade performance. Be sure to test application performance with and without the private graphics state before committing to its use.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- `setUpGState` (page 3173)
- `gState` (page 3128)
- `renewGState` (page 3152)
- `releaseGState` (page 3149)
- `lockFocus` (page 3135)

**Declared In**

`NSView.h`

## **alphaValue**

Returns the opacity of the receiver

- (CGFloat)alphaValue

### Return Value

The current opacity of the receiver

### Discussion

This method returns the value of the `opacity` property of the receiver's layer. Possible values are between 0.0 (transparent) and 1.0 (opaque). The default is 1.0.

Sending this message to a view that is not managing a Core Animation layer causes an exception.

### Availability

Available in Mac OS X v10.5 and later.

### Related Sample Code

RoundTransparentWindow

### Declared In

NSView.h

## ancestorSharedWithView:

Returns the closest ancestor shared by the receiver and a given view.

- (NSView \*)ancestorSharedWithView:(NSView \*)aView

### Parameters

*aView*

The view to test (along with the receiver) for closest shared ancestor.

### Return Value

The closest ancestor or `nil` if there's no such object. Returns `self` if *aView* is identical to the receiver.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [isDescendantOf:](#) (page 3130)

### Declared In

NSView.h

## autoresizesSubviews

Returns YES if the receiver automatically resizes its subviews using [resizeSubviewsWithOldSize:](#) (page 3153) whenever its frame size changes, NO otherwise.

- (BOOL)autoresizesSubviews

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [setAutoresizesSubviews:](#) (page 3158)

**Declared In**

NSView.h

**autoresizingMask**

Returns the receiver's autoresizing mask, which determines how it's resized by the [resizeWithOldSuperviewSize:](#) (page 3154) method.

- (NSUInteger)autoresizingMask

**Return Value**

An integer bit mask specified by combining using the C bitwise OR operator any of the options described in [“Resizing masks”](#) (page 3190).

**Discussion**

If the autoresizing mask is equal to `NSViewNotSizable` (that is, if none of the options are set), then the receiver doesn't resize at all in [resizeWithOldSuperviewSize:](#) (page 3154).

**Availability**

Available in Mac OS X v10.0 and later.

**Related Sample Code**

PredicateEditorSample

**Declared In**

NSView.h

**autoscroll:**

Scrolls the receiver's closest ancestor `NSClipView` object proportionally to the distance of an event that occurs outside of it.

- (BOOL)autoscroll:(NSEvent \*)*theEvent*

**Parameters**

*theEvent*

An event object whose location should be expressed in the window's base coordinate system (which it normally is), not the receiving view's.

**Return Value**

Returns YES if any scrolling is performed; otherwise returns NO.

**Discussion**

View objects that track mouse-dragged events can use this method to scroll automatically when the cursor is dragged outside of the `NSClipView` object. Repeated invocations of this method (with an appropriate delay) result in continual scrolling, even when the mouse doesn't move.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [autoscroll:](#) (page 634) (`NSClipView`)
- [scrollPoint:](#) (page 3156)

- [isDescendantOf:](#) (page 3130)

**Declared In**

NSView.h

## backgroundFilters

Returns the array of CoreImage filters that are applied to the receiver's background

- (NSArray \*)backgroundFilters

**Return Value**

An array of CoreImage filters.

**Discussion**

This method returns the value of the `backgroundFilters` property of the receiver's layer.

Sending this message to a view that is not managing a Core Animation layer causes an exception.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSView.h

## beginDocument

Invoked at the beginning of the printing session, this method sets up the current graphics context.

- (void)beginDocument

**Discussion**

Note that this method may be invoked in a subthread.

Override it to configure printing related settings. You should store your settings in the object returned by `NSPrintInfo`'s [sharedPrintInfo](#) (page 2026) class method, which is guaranteed to return an instance specific to the thread in which you invoke this method. If you override this method, call the superclass implementation.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSView.h

## beginPageInRect:atPlacement:

Called at the beginning of each page, this method sets up the coordinate system so that a region inside the receiver's bounds is translated to a specified location..

- (void)beginPageInRect:(NSRect)aRect atPlacement:(NSPoint)location

**Parameters***aRect*

A rectangle defining the region to be translated.

*location*

A point that is the end-point of translation.

**Discussion**

If you override this method, be sure to call the superclass implementation.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSView.h

**bitmapImageRepForCachingDisplayInRect:**

Returns a bitmap-representation object suitable for caching the specified portion of the receiver.

- (NSBitmapImageRep \*)bitmapImageRepForCachingDisplayInRect:(NSRect)aRect

**Parameters***aRect*

A rectangle defining the area of the receiver to be cached.

**Return Value**

An autoreleased NSBitmapImageRep object or nil if the object could not be created.

**Discussion**

Passing the visible rectangle of the receiver ([self visibleRect]) returns a bitmap suitable for caching the current contents of the view, including all of its descendants.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [cacheDisplayInRect:toBitmapImageRep:](#) (page 3104)

**Related Sample Code**

CarbonCocoaCoreImageTab

Reducer

**Declared In**

NSView.h

**bounds**

Returns the receiver's bounds rectangle, which expresses its location and size in its own coordinate system.

- (NSRect)bounds

**Discussion**

By default, the origin of the returned rectangle is (0, 0) and its size matches the size of the receiver's frame rectangle (measured in points). In Mac OS X v10.5 and later, if the receiver is being rendered into an OpenGL graphics context (using an `NSOpenGLContext` object), the default bounds origin is still (0, 0) but the default bounds size is measured in pixels instead of points. Thus, for user space scale factors other than 1.0, the default size of the bounds rectangle may be bigger or smaller than the default size of the frame rectangle when drawing with OpenGL.

**Important:** Developers of OpenGL applications should not rely on this method converting coordinates to pixels automatically in future releases. Instead, you should convert coordinates to device space explicitly using the [convertPointToBase:](#) (page 3108), [convertSizeToBase:](#) (page 3112), or [convertRectToBase:](#) (page 3110) methods or their earlier counterparts [convertPoint:toView:](#) (page 3107), [convertSize:toView:](#) (page 3111), or [convertRect:toView:](#) (page 3109).

If you explicitly change the origin or size of the bounds rectangle, this method does not return the default rectangle and instead returns the rectangle you set. If you add a rotation factor to the view, however, that factor is also reflected in the returned bounds rectangle. You can determine if a rotation factor is in effect by calling the [boundsRotation](#) (page 3103) method.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [frame](#) (page 3125)
- [setBounds:](#) (page 3160)

**Related Sample Code**

WhackedTV

**Declared In**

NSView.h

## boundsRotation

Returns the angle, in degrees, of the receiver's bounds rectangle relative to its frame rectangle.

- (CGFloat)boundsRotation

**Discussion**

See the [setBoundsRotation:](#) (page 3161) method description for more information on bounds rotation.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [rotateByAngle:](#) (page 3154)
- [setBoundsRotation:](#) (page 3161)

**Declared In**

NSView.h

**cacheDisplayInRect:toBitmapImageRep:**

Draws the specified area of the receiver, and its descendants, into a provided bitmap-representation object.

```
- (void)cacheDisplayInRect:(NSRect)rect toBitmapImageRep:(NSBitmapImageRep
*)bitmapImageRep
```

**Parameters***rect*

A rectangle defining the region to be drawn into *bitmapImageRep*.

*bitmapImageRep*

An `NSBitmapImageRep` object. For pixel-format compatibility, *bitmapImageRep* should have been obtained from `bitmapImageRepForCachingDisplayInRect:` (page 3102).

**Discussion**

You are responsible for initializing the bitmap to the desired configuration before calling this method. However, once initialized, you can reuse the same bitmap multiple times to refresh the cached copy of your view's contents.

The bitmap produced by this method is transparent (that is, has an alpha value of 0) wherever the receiver and its descendants do not draw any content.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- `bitmapImageRepForCachingDisplayInRect:` (page 3102)

**Related Sample Code**

CarbonCocoaCoreImageTab

Reducer

**Declared In**

NSView.h

**canBecomeKeyView**

Returns YES if the receiver can become key view, NO otherwise.

```
- (BOOL)canBecomeKeyView
```

**Availability**

Available in Mac OS X v10.3 and later.

**Declared In**

NSView.h

## canDraw

Returns YES if drawing commands will produce any result, NO otherwise.

- (BOOL)canDraw

### Discussion

Use this method when invoking a draw method directly along with [lockFocus](#) (page 3135) and [unlockFocus](#) (page 3180), bypassing the `display...` methods (which test drawing ability and perform locking for you). If this method returns NO, you shouldn't invoke [lockFocus](#) (page 3135) or perform any drawing.

A view object can draw on-screen if it is not hidden, it is attached to a view hierarchy in a window (NSWindow), and the window has a corresponding window device. A view object can draw during printing if it is a descendant of the view being printed.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [setHidden:](#) (page 3167)

### Declared In

NSView.h

## centerScanRect:

Converts the corners of a specified rectangle to lie on the center of device pixels, which is useful in compensating for rendering overscanning when the coordinate system has been scaled.

- (NSRect)centerScanRect:(NSRect)aRect

### Parameters

*aRect*

The rectangle whose corners are to be converted.

### Return Value

The adjusted rectangle.

### Discussion

This method converts the given rectangle to device coordinates, adjusts the rectangle to lie in the center of the pixels, and converts the resulting rectangle back to the receiver's coordinate system. Note that this method does not take into account any transformations performed using the `NSAffineTransform` class or Quartz 2D routines.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [isRotatedOrScaledFromBase](#) (page 3133)

### Related Sample Code

Sketch-112

**Declared In**

NSView.h

**compositingFilter**

Returns the CoreImage filter that is used to composite the receiver's contents with the background

- (CIFilter \*)compositingFilter

**Return Value**

The CoreImage filter.

**Discussion**

This method returns the value of the `filters` property of the receiver's layer.

Sending this message to a view that is not managing a Core Animation layer causes an exception.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSView.h

**contentFilters**

Returns the array of CoreImage filters that are applied to the contents of the receiver and its sublayers.

- (NSArray \*)contentFilters

**Return Value**

An array of CoreImage filters

**Discussion**

This method returns the value of the `filters` property of the receiver's layer.

Sending this message to a view that is not managing a Core Animation layer causes an exception.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSView.h

**convertPoint:fromView:**

Converts a point from the coordinate system of a given view to that of the receiver.

- (NSPoint)convertPoint:(NSPoint)aPoint fromView:(NSView \*)aView

**Parameters**

*aPoint*

A point specifying a location in the coordinate system of *aView*.

*aView*

The view with *aPoint* in its coordinate system. If *aView* is `nil`, this method instead converts from window base coordinates. Otherwise, both *aView* and the receiver must belong to the same `NSWindow` object.

#### Return Value

The point converted to the coordinate system of the receiver.

#### Availability

Available in Mac OS X v10.0 and later.

## convertPoint:toView:

Converts a point from the receiver's coordinate system to that of a given view.

```
- (NSPoint)convertPoint:(NSPoint)aPoint toView:(NSView *)aView
```

#### Parameters

*aPoint*

A point specifying a location in the coordinate system of the receiver.

*aView*

The view into whose coordinate system *aPoint* is to be converted. If *aView* is `nil`, this method instead converts to window base coordinates. Otherwise, both *aView* and the receiver must belong to the same `NSWindow` object.

#### Return Value

The point converted to the coordinate system of *aView*.

#### Availability

Available in Mac OS X v10.0 and later.

**convertPointToBase:**

Converts the point from the receiver's coordinate system to the base coordinate system.

```
- (NSPoint)convertPointToBase:(NSPoint)aPoint
```

**Parameters***aPoint*

A point specifying a location in the coordinate system of the receiver.

**Return Value**

The point converted to the base coordinate system.

**Discussion**

See View Coordinate Conversion in *View Programming Guide for Cocoa* for a description of view coordinate to base coordinate conversion.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSView.h

**convertRect:fromView:**

Converts a rectangle from the coordinate system of another view to that of the receiver.

- (NSRect)convertRect:(NSRect)aRect fromView:(NSView \*)aView

### Parameters

*aRect*

The rectangle in *aView*'s coordinate system.

*aView*

The view with *aRect* in its coordinate system. If *aView* is `nil`, this method instead converts from window base coordinates. Otherwise, both *aView* and the receiver must belong to the same `NSWindow` object.

### Return Value

The converted rectangle.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

**convertRectFromBase:**

Converts the rectangle from the base coordinate system to the receiver's coordinate system.

```
- (NSRect)convertRectFromBase:(NSRect)aRect
```

**Parameters***aRect*

A rectangle in the base coordinate system

**Return Value**

A rectangle in the receiver's coordinate system

**Discussion**

See View Coordinate Conversion in *View Programming Guide for Cocoa* for a description of view coordinate to base coordinate conversion.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSView.h

**convertRectToBase:**

Converts the rectangle from the receiver's coordinate system to the base coordinate system.

```
- (NSRect)convertRectToBase:(NSRect)aRect
```

**Parameters***aRect*

A rectangle in the receiver's coordinate system

**Return Value**

A rectangle in the base coordinate system

**Discussion**

See View Coordinate Conversion in *View Programming Guide for Cocoa* for a description of view coordinate to base coordinate conversion.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSView.h

**convertSize:fromView:**

Converts a size from another view's coordinate system to that of the receiver.

```
- (NSSize)convertSize:(NSSize)aSize fromView:(NSView *)aView
```

**Parameters***aSize*

The size (width and height) in *aView*'s coordinate system.

*aView*

The view with *aSize* in its coordinate system. If *aView* is `nil`, this method instead converts from window base coordinates. Otherwise, both *aView* and the receiver must belong to the same `NSWindow` object.

**Return Value**

The converted size, as an `NSSize` structure.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [convertPoint:fromView:](#) (page 3106)

NSView.h

**convertSizeFromBase:**

Converts the size from the base coordinate system to the receiver's coordinate system.

```
- (NSSize)convertSizeFromBase:(NSSize)aSize
```

**Parameters***aSize*

A size in the base coordinate system

**Return Value**

The size converted to the receiver's coordinate system.

**Discussion**

See View Coordinate Conversion in *View Programming Guide for Cocoa* for a description of view coordinate to base coordinate conversion.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSView.h

**convertSizeToBase:**

Converts the size from the receiver's coordinate system to the base coordinate system.

```
- (NSSize)convertSizeToBase:(NSSize)aSize
```

**Parameters***aSize*

A size in the receiver's coordinate system

**Return Value**

The size converted to the base coordinate system.

**Discussion**

See View Coordinate Conversion in *View Programming Guide for Cocoa* for a description of view coordinate to base coordinate conversion.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSView.h

**dataWithEPSInsideRect:**

Returns EPS data that draws the region of the receiver within a specified rectangle.

```
- (NSData *)dataWithEPSInsideRect:(NSRect)aRect
```

**Parameters**

*aRect*

A rectangle defining the region.

**Discussion**

This data can be placed on an `NSPasteboard` object, written to a file, or used to create an `NSImage` object.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [writeEPSInsideRect:toPasteboard:](#) (page 3189)

**Declared In**

`NSView.h`

**dataWithPDFInsideRect:**

Returns PDF data that draws the region of the receiver within a specified rectangle.

```
- (NSData *)dataWithPDFInsideRect:(NSRect)aRect
```

**Parameters**

*aRect*

A rectangle defining the region.

**Discussion**

This data can be placed on an `NSPasteboard` object, written to a file, or used to create an `NSImage` object.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [writePDFInsideRect:toPasteboard:](#) (page 3189)

**Related Sample Code**

Sketch-112

**Declared In**

`NSView.h`

**didAddSubview:**

Overridden by subclasses to perform additional actions when subviews are added to the receiver.

```
- (void)didAddSubview:(NSView *)subview
```

**Parameters**

*subview*

The view that was added as a subview.

**Discussion**

This method is invoked by [addSubview:](#) (page 3092).

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSView.h

## discardCursorRects

Invalidates all cursor rectangles set up using [addCursorRect:cursor:](#) (page 3092).

- (void)discardCursorRects

**Discussion**

You need never invoke this method directly; neither is it typically invoked during the invalidation of cursor rectangles. `NSWindow` automatically invalidates cursor rectangles in response to [invalidateCursorRectsForView:](#) (page 3269) and before the receiver's cursor rectangles are reestablished using [resetCursorRects](#) (page 3153). This method is invoked just before the receiver is removed from a window and when the receiver is deallocated.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [discardCursorRects](#) (page 3255) (`NSWindow`)

**Declared In**

NSView.h

## display

Displays the receiver and all its subviews if possible, invoking each the `NSView` methods [lockFocus](#) (page 3135), [drawRect:](#) (page 3121), and [unlockFocus](#) (page 3180) as necessary.

- (void)display

**Discussion**

If the receiver isn't opaque, this method backs up the view hierarchy to the first opaque ancestor, calculates the portion of the opaque ancestor covered by the receiver, and begins displaying from there.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [canDraw](#) (page 3105)
- [opaqueAncestor](#) (page 3141)
- [visibleRect](#) (page 3186)
- [displayIfNeededIgnoringOpacity](#) (page 3115)

**Related Sample Code**

CIVideoDemoGL

Cocoa - SGDataProc

LiveVideoMixer2

StickiesExample

**Declared In**

NSView.h

## displayIfNeeded

Displays the receiver and all its subviews if any part of the receiver has been marked as needing display with a [setNeedsDisplay:](#) (page 3169) or [setNeedsDisplayInRect:](#) (page 3169) message.

- (void)displayIfNeeded

**Discussion**

This method invokes the NSView methods [lockFocus](#) (page 3135), [drawRect:](#) (page 3121), and [unlockFocus](#) (page 3180) as necessary. If the receiver isn't opaque, this method backs up the view hierarchy to the first opaque ancestor, calculates the portion of the opaque ancestor covered by the receiver, and begins displaying from there.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [display](#) (page 3114)
- [needsDisplay](#) (page 3139)
- [displayIfNeededIgnoringOpacity](#) (page 3115)

**Declared In**

NSView.h

## displayIfNeededIgnoringOpacity

Acts as [displayIfNeeded](#) (page 3115), except that this method doesn't back up to the first opaque ancestor—it simply causes the receiver and its descendants to execute their drawing code.

- (void)displayIfNeededIgnoringOpacity

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSView.h

## displayIfNeededInRect:

Acts as [displayIfNeeded](#) (page 3115), confining drawing to a specified region of the receiver..

- (void)displayIfNeededInRect:(NSRect)aRect

**Parameters***aRect*

A rectangle defining the region to be redrawn. It should be specified in the coordinate system of the receiver.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSView.h

**displayIfNeededInRectIgnoringOpacity:**

Acts as [displayIfNeeded](#) (page 3115), but confining drawing to *aRect* and not backing up to the first opaque ancestor—it simply causes the receiver and its descendants to execute their drawing code.

```
- (void)displayIfNeededInRectIgnoringOpacity:(NSRect)aRect
```

**Parameters***aRect*

A rectangle defining the region to be redrawn. It should be specified in the coordinate system of the receiver.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSView.h

**displayRect:**

Acts as [display](#) (page 3114), but confining drawing to a rectangular region of the receiver.

```
- (void)displayRect:(NSRect)aRect
```

**Parameters***aRect*

A rectangle defining the region of the receiver to be redrawn; should be specified in the coordinate system of the receiver.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSView.h

**displayRectIgnoringOpacity:**

Displays the receiver but confines drawing to a specified region and does not back up to the first opaque ancestor—it simply causes the receiver and its descendants to execute their drawing code.

```
- (void)displayRectIgnoringOpacity:(NSRect)aRect
```

**Parameters***aRect*

A rectangle defining the region of the receiver to be redrawn; should be specified in the coordinate system of the receiver.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSView.h

**displayRectIgnoringOpacity:inContext:**

Causes the receiver and its descendants to be redrawn to the specified graphics context.

```
- (void)displayRectIgnoringOpacity:(NSRect)aRect inContext:(NSGraphicsContext *)context
```

**Parameters***aRect*

A rectangle defining the region of the receiver to be redrawn. It should be specified in the coordinate system of the receiver.

*context*

The graphics context in which drawing will occur. See the discussion below for more about this parameter.

**Discussion**

Acts as [display](#) (page 3114), but confines drawing to *aRect*. This method initiates drawing with the receiver, even if the receiver is not opaque. Appropriate scaling factors for the view are obtained from *context*.

If the *context* parameter represents the context for the window containing the view, then all of the necessary transformations are applied. This includes the application of the receiver's bounds and frame transforms along with any transforms it inherited from its ancestors. In this situation, the view is also marked as no longer needing an update for the specified rectangle.

If *context* specifies any other graphics context, then only the receiver's bounds transform is applied. This means that drawing is not constrained to the view's visible rectangle. It also means that any dirty rectangles are not cleared, since they are not being redrawn to the window.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

NSView.h

**dragFile:fromRect:slideBack:event:**

Initiates a dragging operation from the receiver, allowing the user to drag a file icon to any application that has window or view objects that accept files.

```
- (BOOL)dragFile:(NSString *)fullPath fromRect:(NSRect)aRect
slideBack:(BOOL)slideBack event:(NSEvent *)theEvent
```

**Parameters***fullPath*

A string that specifies the absolute path for the file that is dragged.

*aRect*

A rectangle that describes the position of the icon in the receiver's coordinate system.

*slideBack*

A Boolean that indicates whether the icon being dragged should slide back to its position in the receiver if the file isn't accepted. The icon slides back to *aRect* if *slideBack* is YES, the file is not accepted by the dragging destination, and the user has not disabled icon animation; otherwise it simply disappears.

*theEvent*

The mouse-down event object from which to initiate the drag operation. In particular, its mouse location is used for the offset of the icon being dragged.

**Return Value**

YES if the receiver successfully initiates the dragging operation (which doesn't necessarily mean the dragging operation concluded successfully). Otherwise returns NO.

**Discussion**

This method must be invoked only within an implementation of the [mouseDown:](#) (page 2133) method.

See the [NSDraggingSource](#), [NSDraggingInfo](#), and [NSDraggingDestination](#) protocol specifications for more information on dragging operations.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [dragImage:at:offset:event:pasteboard:source:slideBack:](#) (page 3118)
- [shouldDelayWindowOrderingForEvent:](#) (page 3174)

**Declared In**

NSView.h

**dragImage:at:offset:event:pasteboard:source:slideBack:**

Initiates a dragging operation from the receiver, allowing the user to drag arbitrary data with a specified icon into any application that has window or view objects that accept dragged data.

```
- (void)dragImage:(NSImage *)anImage at:(NSPoint)imageLoc offset:(NSSize)mouseOffset
 event:(NSEvent *)theEvent pasteboard:(NSPasteboard *)pboard
 source:(id)sourceObject slideBack:(BOOL)slideBack
```

**Parameters***anImage*

The NSImage object to be dragged.

*imageLoc*

The location of the image's lower-left corner, in the receiver's coordinate system. It determines the placement of the dragged image under the cursor. When determining the image location you should use the mouse down coordinate, provided in *theEvent*, rather than the current mouse location.

*mouseOffset*

The mouse's current location relative to the mouse-down location. In Mac OS X v10.4 and later, this parameter is ignored. In earlier versions of Mac OS X, this parameter is ignored when positioning the dragged image on screen but not ignored when passing the drag location to the source in `draggedImage:endedAt:operation:`.

Historically, this argument represented the difference between the mouse position when the drag operation commenced and the mouse position of the initial mouse down. If you initiated a dragging operation immediately on a mouse-down event, this offset was (0.0, 0.0). If you tested for a mouse-dragged event first, this offset was the difference between the mouse-dragged event's location and that of the mouse-down event. Since the underlying drag machinery now takes the current mouse position into account when positioning the drag image, this argument is no longer necessary.

*theEvent*

The left mouse-down event that triggered the dragging operation (see discussion below).

*pboard*

The pasteboard that holds the data to be transferred to the destination (see discussion below).

*sourceObject*

An object that serves as the controller of the dragging operation. It must conform to the `NSDraggingSource` informal protocol and is typically the receiver itself or its `NSWindow` object.

*slideBack*

A Boolean that determines whether the drag image should slide back if it's rejected. The image slides back to *imageLoc* if *slideBack* is YES and the image isn't accepted by the dragging destination. If NO the image doesn't slide back.

**Discussion**

This method must be invoked only within an implementation of the `mouseDown:` (page 2133) or `mouseDragged:` (page 2134) methods.

Before invoking this method, you must place the data to be transferred on *pboard*. To do this, get the drag pasteboard object (`NSDragPboard`), declare the types of the data, and then put the data on the pasteboard. This code fragment initiates a dragging operation on an image itself (that is, the image is the data to be transferred):

```
- (void)mouseDown:(NSEvent *)theEvent
{
 NSSize dragOffset = NSMakeSize(0.0, 0.0);
 NSPasteboard *pboard;

 pboard = [NSPasteboard pasteboardWithName:NSDragPboard];
 [pboard declareTypes:[NSArray arrayWithObject:NSTIFFPboardType] owner:self];
 [pboard setData:[self image] TIFFRepresentation forType:NSTIFFPboardType];

 [self dragImage:[self image] at:[self imageLocation] offset:dragOffset
 event:theEvent pasteboard:pboard source:self slideBack:YES];

 return;
}
```

See the `NSDraggingSource`, `NSDraggingInfo`, and `NSDraggingDestination` protocol specifications for more information on dragging operations.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [dragFile:fromRect:slideBack:event:](#) (page 3117)
- [shouldDelayWindowOrderingForEvent:](#) (page 3174)

**Declared In**

NSView.h

**dragPromisedFilesOfTypes:fromRect:source:slideBack:event:**

Initiates a dragging operation from the receiver, allowing the user to drag one or more promised files (or directories) into any application that has window or view objects that accept promised file data.

```
- (BOOL)dragPromisedFilesOfTypes:(NSArray *)typeArray fromRect:(NSRect)aRect
 source:(id)sourceObject slideBack:(BOOL)slideBack event:(NSEvent *)theEvent
```

**Parameters***typeArray*

An array of file types being promised. The array elements can consist of file extensions and HFS types encoded with the `NSFileTypeForHFSTypeCode` function. If promising a directory of files, only include the top directory in the array.

*aRect*

A rectangle that describes the position of the icon in the receiver's coordinate system.

*sourceObject*

An object that serves as the controller of the dragging operation. It must conform to the `NSDraggingSource` informal protocol, and is typically the receiver itself or its `NSWindow` object.

*slideBack*

A Boolean that indicates whether the icon being dragged should slide back to its position in the receiver if the file isn't accepted. The icon slides back to *aRect* if *slideBack* is YES, the promised files are not accepted by the dragging destination, and the user has not disabled icon animation; otherwise it simply disappears.

*theEvent*

The mouse-down event object from which to initiate the drag operation. In particular, its mouse location is used for the offset of the icon being dragged.

**Return Value**

YES if the drag operation is initiated successfully, NO otherwise.

**Discussion**

This method must be invoked only within an implementation of the [mouseDown:](#) (page 2133) method. As part of its implementation, this method invokes

[dragImage:at:offset:event:pasteboard:source:slideBack:](#) (page 3118).

Promised files are files that do not exist, yet, but that the drag source, *sourceObject*, promises to create at a file system location specified by the drag destination when the drag is successfully dropped.

See *Drag and Drop Programming Topics for Cocoa* for more information on dragging operations.

**Availability**

Available in Mac OS X v10.2 and later.

**See Also**

- [dragImage:at:offset:event:pasteboard:source:slideBack:](#) (page 3118)

- [shouldDelayWindowOrderingForEvent:](#) (page 3174)

**Declared In**

NSView.h

**drawPageBorderWithSize:**

Allows applications that use the Application Kit pagination facility to draw additional marks on each logical page.

- (void)drawPageBorderWithSize:(NSSize)*borderSize*

**Parameters**

*borderSize*

An NSSize structure that defines a logical page.

**Discussion**

The marks can be such things as alignment marks or a virtual sheet border of size *borderSize*. The default implementation doesn't draw anything.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [drawSheetBorderWithSize:](#) (page 3122)

**Declared In**

NSView.h

**drawRect:**

Overridden by subclasses to draw the receiver's image within the passed-in rectangle.

- (void)drawRect:(NSRect)*dirtyRect*

**Parameters**

*aRect*

A rectangle defining the dirty area of the view that requires redrawing.

**Discussion**

The receiver can assume the focus has been locked and the coordinate transformations of its frame and bounds rectangles have been applied; all it needs to do is invoke rendering client functions.

You can avoid unnecessary drawing by paying attention to the *dirtyRect* parameter which defines the area that must be redrawn. The bounds of the entire view, as opposed to the dirty region, is given by [self bounds].

On Mac OS X version 10.2 and earlier, the Application Kit automatically clips any drawing you perform in this method to this rectangle. On Mac OS X version 10.3 and later, the Application Kit automatically clips drawing to a list of non-overlapping rectangles that more rigorously specify the area needing drawing. You can invoke the [getRectsBeingDrawn:count:](#) (page 3126) method to retrieve this list of rectangles and use them to

constrain your drawing more tightly, if you wish. Moreover, the [needsToDrawRect:](#) (page 3139) method gives you a convenient way to test individual objects for intersection with the rectangles in the list. See *Cocoa Drawing Guide* for information and references on drawing.

The default implementation does nothing. If your custom view is a direct `NSView` subclass you do not need to call `super`'s implementation.

**Note:** If a subclass returns YES upon receiving an [isOpaque](#) (page 3132) message, it must completely fill *aRect* with opaque content.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [display](#) (page 3114)

**drawSheetBorderWithSize:**

Allows applications that use the Application Kit pagination facility to draw additional marks on each printed sheet.

```
- (void)drawSheetBorderWithSize:(NSSize)borderSize
```

**Parameters**

*borderSize*

An `NSSize` structure that defines a printed sheet.

**Discussion**

The marks can be such things as crop marks or fold lines of size *borderSize*. This method has been deprecated.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [drawPageBorderWithSize:](#) (page 3121)

**Declared In**

NSView.h

**enclosingMenuItem**

Returns the menu item containing the receiver or any of its superviews in the view hierarchy.

- (NSMenuItem \*)enclosingMenuItem

**Return Value**

Returns the menu item containing the receiver or any of its superviews in the view hierarchy, or `nil` if the receiver's view hierarchy is not in a menu item

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSMenuItem.h

**enclosingScrollView**

Returns the nearest ancestor `NSScrollView` object containing the receiver (not including the receiver itself); otherwise returns `nil`.

- (NSScrollView \*)enclosingScrollView

**Availability**

Available in Mac OS X v10.0 and later.

**Related Sample Code**

NSView.h

**endDocument**

This method is invoked at the end of the printing session.

- (void)endDocument

**Discussion**

If you override this method, call the superclass implementation.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSView.h

## endPage

Writes the end of a conforming page.

- (void)endPage

### Discussion

This method is invoked after each page is printed. It invokes [unlockFocus](#) (page 3180). This method also generates comments for the bounding box and page fonts, if they were specified as being at the end of the page.

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

NSView.h

## enterFullScreenMode:withOptions:

Sets the receiver to full screen mode.

- (BOOL)enterFullScreenMode:(NSScreen \*)*screen* withOptions:(NSDictionary \*)*options*

### Parameters

*screen*

The screen the receiver should cover.

*options*

A dictionary of options for the mode. For possible keys, see “[Full screen mode](#)” (page 3192).

### Return Value

YES if the receiver was able to enter full screen mode, otherwise NO.

### Availability

Available in Mac OS X v10.5 and later.

### Declared In

NSView.h

## exitFullScreenModeWithOptions:

Instructs the receiver to exit full screen mode.

- (void)exitFullScreenModeWithOptions:(NSDictionary \*)*options*

### Parameters

*options*

A dictionary of options for the mode. For possible keys, see “[Full screen mode](#)” (page 3192).

### Availability

Available in Mac OS X v10.5 and later.

### Declared In

NSView.h

## focusRingType

Returns the type of focus ring drawn around the receiver.

- (NSFocusRingType)focusRingType

### Return Value

An `enum` constant identifying a type of focus ring. Possible values are listed in [NSFocusRingType](#) (page 3705).

### Discussion

You can disable a view's drawing of its focus ring by overriding this method to return `NSFocusRingTypeNone`, or by invoking [setFocusRingType:](#) (page 3164) with an argument of `NSFocusRingTypeNone`. You should only disable the default drawing of a view's focus ring if you want it to draw its own focus ring (for example, setting the background color of the view), or if the view does not have sufficient space to display a focus ring.

### Availability

Available in Mac OS X v10.3 and later.

### See Also

- [setFocusRingType:](#) (page 3164)

### Declared In

NSView.h

## frame

Returns the receiver's frame rectangle, which defines its position in its superview.

- (NSRect)frame

### Discussion

The frame rectangle may be rotated; use the [frameRotation](#) (page 3126) method to check this.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [bounds](#) (page 3102)

- [setFrame:](#) (page 3164)

### Related Sample Code

### Declared In

NSView.h

## frameCenterRotation

Returns the receiver's rotation about the layer's position.

- (CGFloat)frameCenterRotation

### Return Value

The angle of rotation of the frame around the center of the receiver.

### Discussion

If the application has altered the layer's `anchorPoint` property, the behavior is undefined. Sending this message to a view that is not managing a Core Animation layer causes an exception.

### Availability

Available in Mac OS X v10.5 and later.

### Declared In

NSView.h

## frameRotation

Returns the angle, in degrees, of the receiver's frame relative to its superview's coordinate system.

- (CGFloat)frameRotation

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [setFrameRotation:](#) (page 3166)
- [boundsRotation](#) (page 3103)

### Declared In

NSView.h

## getRectsBeingDrawn:count:

Returns by indirection a list of non-overlapping rectangles that define the area the receiver is being asked to draw in [drawRect:](#) (page 3121).

- (void)getRectsBeingDrawn:(const NSRect \*\*)rects count:(NSInteger \*)count

### Parameters

*rects*

On return, contains a list of non-overlapping rectangles defining areas to be drawn in. The rectangles returned in *rects* are in the coordinate space of the receiver.

*count*

On return, the number of rectangles in the *rects* list.

### Discussion

An implementation of `drawRect:` can use this information to test whether objects or regions within the view intersect with the rectangles in the list, and thereby avoid unnecessary drawing that would be completely clipped away.

The [needsToDrawRect:](#) (page 3139) method gives you a convenient way to test individual objects for intersection with the area being drawn in [drawRect:](#) (page 3121). However, you may want to retrieve and directly inspect the rectangle list if this is a more efficient way to perform intersection testing.

You should send this message only from within a [drawRect:](#) (page 3121) implementation. The *aRect* parameter of [drawRect:](#) is the rectangle enclosing the returned list of rectangles; you can use it in an initial pass to reject objects that are clearly outside the area to be drawn.

#### Availability

Available in Mac OS X v10.3 and later.

#### See Also

- [wantsDefaultClipping](#) (page 3187)

#### Declared In

NSView.h

## getRectsExposedDuringLiveResize:count:

Returns a list of rectangles indicating the newly exposed areas of the receiver.

```
- (void)getRectsExposedDuringLiveResize:(NSRect)exposedRects count:(NSInteger *)count
```

#### Parameters

*exposedRects*

On return, contains the list of rectangles. The returned rectangles are in the coordinate space of the receiver.

*count*

Contains the number of rectangles in *exposedRects*; this value may be 0 and is guaranteed to be no more than 4.

#### Discussion

If your view does not support content preservation during live resizing, the entire area of your view is returned in the *exposedRects* parameter. To support content preservation, override [preservesContentDuringLiveResize](#) (page 3144) in your view and have your implementation return YES.

**Note:** The window containing your view must also support content preservation. To enable support for this feature in your window, use the [setPreservesContentDuringLiveResize:](#) (page 3323) method of `NSWindow`.

If the view decreased in both height and width, the list of returned rectangles will be empty. If the view increased in both height and width and its upper-left corner stayed anchored in the same position, the list of returned rectangles will contain a vertical and horizontal component indicating the exposed area.

#### Availability

Available in Mac OS X v10.4 and later.

#### See Also

- [preservesContentDuringLiveResize](#) (page 3144)  
- [rectPreservedDuringLiveResize](#) (page 3147)

**Declared In**

NSView.h

## gState

Returns the identifier for the receiver's graphics state object, or 0 if the receiver doesn't have a graphics state object.

- (NSInteger)gState

**Discussion**

A view object's graphics state object is recreated from scratch whenever the view is focused, unless the [allocateGState](#) (page 3098) method has been invoked. So if the receiver hasn't been focused or hasn't received the [allocateGState](#) (page 3098) message, this method returns 0.

Although applications rarely need to use the value returned by [gState](#) (page 3128), it can be passed to the few methods that take an object identifier as a parameter.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [allocateGState](#) (page 3098)
- [setUpGState](#) (page 3173)
- [renewGState](#) (page 3152)

- [lockFocus](#) (page 3135)

**Declared In**

NSView.h

## heightAdjustLimit

Returns the fraction (from 0.0 to 1.0) of the page that can be pushed onto the next page during automatic pagination to prevent items such as lines of text from being divided across pages.

- (CGFloat)heightAdjustLimit

**Discussion**

This fraction is used to calculate the bottom edge limit for an [adjustPageHeightNew:top:bottom:limit:](#) (page 3096) message.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [widthAdjustLimit](#) (page 3187)

**Declared In**

NSView.h

## hitTest:

Returns the farthest descendant of the receiver in the view hierarchy (including itself) that contains a specified point, or `nil` if that point lies completely outside the receiver.

- (NSView \*)hitTest:(NSPoint)*aPoint*

### Parameters

*aPoint*

A point that is in the coordinate system of the receiver's superview, not of the receiver itself.

### Return Value

A view object that is the farthest descendent of *aPoint*.

### Discussion

This method is used primarily by an `NSWindow` object to determine which view should receive a mouse-down event. You'd rarely need to invoke this method, but you might want to override it to have a view object hide mouse-down events from its subviews. This method ignores hidden views.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [mouse:inRect:](#) (page 3137)
- [convertPoint:toView:](#) (page 3107)
- [setHidden:](#) (page 3167)

### Declared In

`NSView.h`

## initWithFrame:

Initializes and returns a newly allocated `NSView` object with a specified frame rectangle.

- (id)initWithFrame:(NSRect)*frameRect*

### Parameters

*frameRect*

The frame rectangle for the created view object.

### Return Value

An initialized `NSView` object or `nil` if the object couldn't be created.

### Discussion

The new view object must be inserted into the view hierarchy of a window before it can be used. This method is the designated initializer for the `NSView` class. Returns an initialized object.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

OpenGL Screensaver

WhackedTV

**Declared In**

NSView.h

**isDescendantOf:**

Returns YES if the receiver is a subview of a given view or if it's identical to that view; otherwise, it returns NO.

- (BOOL)isDescendantOf:(NSView \*)aView

**Parameters**

*aView*

The view to test for subview relationship within the view hierarchy.

**Discussion**

The method returns YES if the receiver is either an immediate or distant subview of *aView*.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [superview](#) (page 3177)
- [subviews](#) (page 3176)
- [ancestorSharedWithView:](#) (page 3099)

**Declared In**

NSView.h

## isFlipped

Returns YES if the receiver uses flipped drawing coordinates or NO if it uses native coordinates.

- (BOOL)isFlipped

**Discussion**

The default implementation returns NO; subclasses that use flipped coordinates should override this method to return YES.

**Availability**

Available in Mac OS X v10.0 and later.

**Related Sample Code**

ImageMapExample

Quartz Composer WWDC 2005 TextEdit

Reducer

Sketch-112

TextEditPlus

**Declared In**

NSView.h

## isHidden

Returns whether the receiver is marked as hidden.

- (BOOL)isHidden

**Discussion**

The return value reflects the state of the receiver only, as set in Interface Builder or through the most recent [setHidden:](#) (page 3167) message, and does not account for the state of the receiver's ancestors in the view hierarchy. Thus this method returns NO when the receiver is effectively hidden because it has a hidden ancestor. See [setHidden:](#) for a discussion of the mechanics and implications of hidden views.

If you want to determine whether a view is effectively hidden, for whatever reason, send the [isHiddenOrHasHiddenAncestor](#) (page 3132) to the view instead.

**Availability**

Available in Mac OS X v10.3 and later.

**Related Sample Code**

GLSLShowpiece

**Declared In**

NSView.h

## isHiddenOrHasHiddenAncestor

Returns YES if the receiver is marked as hidden or has an ancestor in the view hierarchy that is marked as hidden; returns NO otherwise.

- (BOOL)isHiddenOrHasHiddenAncestor

### Discussion

The return value reflects state set through the [setVisible:](#) (page 3167) method in the receiver or one of its ancestors in the view hierarchy. It does not account for other reasons why a view might be considered hidden, such as being positioned outside its superview's bounds, not having a window, or residing in a window that is offscreen or overlapped by another window.

### Availability

Available in Mac OS X v10.3 and later.

### See Also

- [isVisible](#) (page 3131)

### Declared In

NSView.h

## isInFullScreenMode

Returns a Boolean value that indicates whether the receiver is in full screen mode.

- (BOOL)isInFullScreenMode

### Return Value

YES if the receiver is in full screen mode, otherwise NO.

### Availability

Available in Mac OS X v10.5 and later.

### Declared In

NSView.h

## isOpaque

Overridden by subclasses to return YES if the receiver is opaque, NO otherwise.

- (BOOL)isOpaque

### Discussion

A view object is opaque if it completely covers its frame rectangle when drawing itself. The default implementation performs no drawing at all and so returns NO.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [opaqueAncestor](#) (page 3141)  
- [displayRectIgnoringOpacity:](#) (page 3116)

- [displayIfNeededIgnoringOpacity](#) (page 3115)
- [displayIfNeededInRectIgnoringOpacity:](#) (page 3116)

TextEditPlus

WhackedTV

**Declared In**

NSView.h

## isRotatedFromBase

Returns YES if the receiver or any of its ancestors has ever received a [setFrameRotation:](#) (page 3166) or [setBoundsRotation:](#) (page 3161) message; otherwise returns NO.

- (BOOL)isRotatedFromBase

**Discussion**

The intent of this information is to optimize drawing and coordinate calculation, not necessarily to reflect the exact state of the receiver's coordinate system, so it may not reflect the actual rotation. For example, if an NSView object is rotated to 45 degrees and later back to 0, this method still returns YES.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [frameRotation](#) (page 3126)
- [boundsRotation](#) (page 3103)

**Declared In**

NSView.h

## isRotatedOrScaledFromBase

Returns YES if the receiver or any of its ancestors has ever had a nonzero frame or bounds rotation, or has been scaled from the window's base coordinate system; otherwise returns NO.

- (BOOL)isRotatedOrScaledFromBase

**Discussion**

The intent of this information is to optimize drawing and coordinate calculation, not necessarily to reflect the exact state of the receiver's coordinate system, so it may not reflect the actual rotation or scaling. For example, if an NSView object is rotated to 45 degrees and later back to 0, this method still returns YES.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [frameRotation](#) (page 3126)

- [boundsRotation](#) (page 3103)
- [centerScanRect:](#) (page 3105)
- [setBounds:](#) (page 3160)
- [setBoundsSize:](#) (page 3162)
- [scaleUnitSquareToSize:](#) (page 3155)

**Declared In**

NSView.h

**knowsPageRange:**

Returns YES if the receiver handles page boundaries, NO otherwise.

- (BOOL)knowsPageRange:(NSRangePointer)aRange

**Parameters***aRange*

On return, holds the page range if YES is returned directly. Page numbers are one-based—that is pages run from one to *N*.

**Discussion**

Returns NO if the receiver uses the default auto-pagination mechanism. The default implementation returns NO. Override this method if your class handles page boundaries.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSView.h

**layer**

Returns the Core Animation layer that the receiver as its backing store.

- (CALayer \*)layer

**Return Value**

The Core Animation layer the receiver is using as its backing store.

**Availability**

Available in Mac OS X v10.5 and later.

**Related Sample Code**

CALayerEssentials

OpenGLCompositorLab

**Declared In**

NSView.h

## locationOfPrintRect:

Invoked by [print:](#) (page 3145) to determine the location of the region of the receiver being printed on the physical page.

- (NSPoint)locationOfPrintRect:(NSRect)aRect

### Parameters

*aRect*

A rectangle defining a region of the receiver; it is expressed in the default coordinate system of the page.

### Return Value

A point to be used for setting the origin for *aRect*, whose size the receiver can examine in order to properly place it. It is expressed in the default coordinate system of the page.

### Discussion

The default implementation places *aRect* according to the status of the `NSPrintInfo` object for the print job. By default it places the image in the upper-left corner of the page, but if the `NSPrintInfo` methods [isHorizontallyCentered](#) (page 2028) or [isVerticallyCentered](#) (page 2029) return YES, it centers a single-page image along the appropriate axis. A multiple-page document, however, is always placed so the divided pieces can be assembled at their edges.

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

`NSView.h`

## lockFocus

Locks the focus on the receiver, so subsequent commands take effect in the receiver's window and coordinate system.

- (void)lockFocus

### Discussion

If you don't use a `display...` method to draw an `NSView` object, you must invoke `lockFocus` before invoking methods that send commands to the window server, and must balance it with an [unlockFocus](#) (page 3180) message when finished.

Hiding or miniaturizing a one-shot window causes the backing store for that window to be released. If you don't use the standard display mechanism to draw, you should use [lockFocusIfCanDraw](#) (page 3136) rather than `lockFocus` if there is a chance of drawing while the window is either miniaturized or hidden.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- + [focusView](#) (page 3091)
- [display](#) (page 3114)
- [drawRect:](#) (page 3121)
- [lockFocusIfCanDraw](#) (page 3136)

**Related Sample Code**

MungSaver

UIKitFrameStepper

VideoViewer

**Declared In**

NSView.h

**lockFocusIfCanDraw**

Locks the focus to the receiver atomically if the `canDraw` method returns YES and returns the value of `canDraw`.

```
- (BOOL)lockFocusIfCanDraw
```

**Discussion**

Your thread will not be preempted by other threads between the `canDraw` method and the lock. This method fails to lock focus and returns NO, when the receiver is hidden and the current context is drawing to the screen (as opposed to a printing context).

**Availability**

Available in Mac OS X v10.0 and later.

**Related Sample Code**

VideoViewer

**Declared In**

NSView.h

**lockFocusIfCanDrawInContext:**

Locks the focus to the receiver atomically if drawing can occur in the specified graphics context.

```
- (BOOL)lockFocusIfCanDrawInContext:(NSGraphicsContext *)context
```

**Parameters***context*

The graphics context in which drawing might occur. See the discussion for the implications of the type of context.

**Return Value**

YES if successful; otherwise, returns NO.

**Discussion**

Your thread will not be preempted by other threads between the `canDraw` method and the lock.

If the *context* parameter represents the context for the window containing the view, then all of the necessary transformations are applied. This includes the application of the receiver's bounds and frame transforms along with any transforms it inherited from its ancestors. If *context* specifies any other graphics context, then only the receiver's bounds transform is applied.

## Special Considerations

**Important:** This method was declared in Mac OS X v10.4, but is not used in that release. It currently does nothing and returns NO. However, it might be implemented in a future release.

### Availability

Available in Mac OS X v10.4 and later.

### See Also

- [lockFocus](#) (page 3135)
- [lockFocusIfCanDraw](#) (page 3136)

### Declared In

NSView.h

## menuForEvent:

Overridden by subclasses to return a context-sensitive pop-up menu for a given mouse-down event.

- (NSMenu \*)menuForEvent:(NSEvent \*)*theEvent*

### Parameters

*theEvent*

An object representing a mouse-down event.

### Discussion

The receiver can use information in the mouse event, such as its location over a particular element of the receiver, to determine what kind of menu to return. For example, a text object might display a text-editing menu when the cursor lies over text and a menu for changing graphics attributes when the cursor lies over an embedded image.

The default implementation returns the receiver's normal menu.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- + [defaultMenu](#) (page 3090)
- [menu](#) (page 2133) (NSResponder)

### Declared In

NSView.h

## mouse:inRect:

Returns whether a region of the receiver contains a specified point, accounting for whether the receiver is flipped or not.

- (BOOL)mouse:(NSPoint)*aPoint* inRect:(NSRect)*aRect*

**Parameters***aPoint*

A point that is expressed in the receiver's coordinate system. This point generally represents the hot spot of the mouse cursor.

*aRect*

A rectangle that is expressed in the receiver's coordinate system.

**Return Value**

YES if *aRect* contains *aPoint*, NO otherwise.

**Discussion**

Point-in-rectangle functions generally assume that the bottom edge of a rectangle is outside of the rectangle boundaries, while the upper edge is inside the boundaries. This method views *aRect* from the point of view of the user—that is, this method always treats the bottom edge of the rectangle as the one closest to the bottom edge of the user's screen. By making this adjustment, this function ensures consistent mouse-detection behavior from the user's perspective.

Never use the Foundation's `NSPointInRect` function as a substitute for this method. It doesn't account for flipped coordinate systems.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [hitTest:](#) (page 3129)
  - [isFlipped](#) (page 3131)
- `NSMouseInRect` (Foundation functions)
- [convertPoint:fromView:](#) (page 3106)

**Declared In**

`NSView.h`

## **mouseDownCanMoveWindow**

Returns YES if the receiver does not need to handle a mouse down and can pass it through to supervIEWS; NO if it needs to handle the mouse down.

- (BOOL)mouseDownCanMoveWindow

**Discussion**

This allows iApp-type applications to determine the region by which a window can be moved. By default, this method returns NO if the view is opaque; otherwise, it returns YES. Subclasses can override this method to return a different value.

**Availability**

Available in Mac OS X v10.2 and later.

**Related Sample Code**

`DockTile`

`SpeedometerView`

`WebKitPluginStarter`

`WebKitPluginWithJavaScript`

**Declared In**

NSView.h

**needsDisplay**

Returns YES if the receiver needs to be displayed, as indicated using [setNeedsDisplay:](#) (page 3169) and [setNeedsDisplayInRect:](#) (page 3169); returns NO otherwise.

- (BOOL)needsDisplay

**Discussion**

The `displayIfNeeded...` methods check this status to avoid unnecessary drawing, and all display methods clear this status to indicate that the view object is up to date.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSView.h

**needsPanelToBecomeKey**

Overridden by subclasses to return YES if the receiver requires its panel, which might otherwise avoid becoming key, to become the key window so that it can handle keyboard input.

- (BOOL)needsPanelToBecomeKey

**Discussion**

Such a subclass should also override [acceptsFirstResponder](#) (page 2117) to return YES. The default implementation returns NO.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [becomesKeyOnlyIfNeeded](#) (page 1856) (NSPanel)

**Related Sample Code**

Clock Control

**Declared In**

NSView.h

**needsToDrawRect:**

Returns whether the specified rectangle intersects any part of the area that the receiver is being asked to draw.

- (BOOL)needsToDrawRect:(NSRect)aRect

**Parameters***aRect*

A rectangle defining a region of the receiver.

**Discussion**

You typically send this message from within a [drawRect:](#) (page 3121) implementation. It gives you a convenient way to determine whether any part of a given graphical entity might need to be drawn. It is optimized to efficiently reject any rectangle that lies outside the bounding box of the area the receiver is being asked to draw in `drawRect:`.

**Availability**

Available in Mac OS X v10.3 and later.

**Declared In**

NSView.h

**nextKeyView**

Returns the view object following the receiver in the key view loop, or `nil` if there is none.

```
- (NSView *)nextKeyView
```

**Discussion**

This view should, if possible, be made first responder when the user navigates forward from the receiver using keyboard interface control.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [nextValidKeyView](#) (page 3140)
- [setNextKeyView:](#) (page 3170)
- [previousKeyView](#) (page 3144)
- [previousValidKeyView](#) (page 3145)
- [selectNextKeyView:](#) (page 3296) (NSWindow)
- [selectKeyViewFollowingView:](#) (page 3295) (NSWindow)
- [selectPreviousKeyView:](#) (page 3297) (NSWindow)
- [selectKeyViewPrecedingView:](#) (page 3296) (NSWindow)

**Related Sample Code**

TrackBall

**Declared In**

NSView.h

**nextValidKeyView**

Returns the closest view object in the key view loop that follows the receiver and actually accepts first responder status, or `nil` if there is none.

```
- (NSView *)nextValidKeyView
```

**Discussion**

This method ignores hidden views when it determines the next valid key view.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [nextKeyView](#) (page 3140)
- [setNextKeyView:](#) (page 3170)
- [previousKeyView](#) (page 3144)
- [previousValidKeyView](#) (page 3145)
- [selectNextKeyView:](#) (page 3296) (NSWindow)
- [selectKeyViewFollowingView:](#) (page 3295) (NSWindow)
- [selectPreviousKeyView:](#) (page 3297) (NSWindow)
- [selectKeyViewPrecedingView:](#) (page 3296) (NSWindow)
- [setHidden:](#) (page 3167)

**Declared In**

NSView.h

## opaqueAncestor

Returns the receiver's closest opaque ancestor (including the receiver itself).

- (NSView \*)opaqueAncestor

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [isOpaque](#) (page 3132)
- [displayRectIgnoringOpacity:](#) (page 3116)
- [displayIfNeededIgnoringOpacity](#) (page 3115)
- [displayIfNeededInRectIgnoringOpacity:](#) (page 3116)

**Declared In**

NSView.h

## pageFooter

Returns a default footer string that includes the current page number and page count.

- (NSAttributedString \*)pageFooter

**Discussion**

A printable view class can override this method to substitute its own content in place of the default value. You should not need to call this method directly. The printing system calls it once per page during printing.

Footers are generated only if the user defaults contain the key `NSPrintHeaderAndFooter` with the value YES.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

– [pageHeader](#) (page 3142)

**Declared In**

NSView.h

## pageHeader

Returns a default header string that includes the print job title and date.

– (NSAttributedString \*)pageHeader

**Discussion**

Typically, the print job title is the same as the window title. A printable view class can override this method to substitute its own content in place of the default value. You should not need to call this method directly. The printing system calls it once per page during printing.

Headers are generated only if the user defaults contain the key `NSPrintHeaderAndFooter` with the value YES.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

– [pageFooter](#) (page 3141)

**Declared In**

NSView.h

## performKeyEquivalent:

Implemented by subclasses to respond to key equivalents (also known as keyboard shortcuts).

– (BOOL)performKeyEquivalent:(NSEvent \*)*theEvent*

**Parameters**

*theEvent*

The key-down event object representing a key equivalent.

**Return Value**

YES if *theEvent* is a key equivalent that the receiver handled, NO if it is not a key equivalent that it should handle.

**Discussion**

If the receiver's key equivalent is the same as the characters of the key-down event *theEvent*, as returned by [charactersIgnoringModifiers](#) (page 1066), the receiver should take the appropriate action and return YES. Otherwise, it should return the result of invoking *super*'s implementation. The default implementation of this method simply passes the message down the view hierarchy (from superviews to subviews) and returns NO if none of the receiver's subviews responds YES.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [performMnemonic:](#) (page 3143)
- [keyDown:](#) (page 3275) (NSWindow)

**Declared In**

NSView.h

## performMnemonic:

Implemented by subclasses to respond to mnemonics.

- (BOOL)performMnemonic:(NSString \*)*aString*

**Parameters**

*aString*

A string representing the mnemonic to handle.

**Discussion**

If the receiver's mnemonic is the same as the characters of the string *aString*, the receiver should take the appropriate action and return YES. Otherwise, it should return the result of invoking *super*'s implementation. The default implementation of this method simply passes the message down the view hierarchy (from superviews to subviews) and returns NO if none of the receiver's subviews responds YES. Mnemonics are not supported in Mac OS X.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [performKeyEquivalent:](#) (page 3142)
- [keyDown:](#) (page 3275) (NSWindow)

**Declared In**

NSView.h

## postsBoundsChangedNotifications

Returns YES if the receiver posts notifications to the default notification center whenever its bounds rectangle changes; returns NO otherwise.

- (BOOL)postsBoundsChangedNotifications

**Discussion**

See [setPostsBoundsChangedNotifications:](#) (page 3170) for a list of methods that result in notifications.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSView.h

## postsFrameChangedNotifications

Returns YES if the receiver posts notifications to the default notification center whenever its frame rectangle changes; returns NO otherwise.

- (BOOL)postsFrameChangedNotifications

### Discussion

See [setPostsBoundsChangedNotifications:](#) (page 3170) for a list of methods that result in notifications.

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

NSView.h

## preservesContentDuringLiveResize

Returns YES if the view supports the optimization of live-resize operations by preserving content that has not moved; otherwise, returns NO.

- (BOOL)preservesContentDuringLiveResize

### Discussion

The default is NO. If your view supports the content preservation feature, you should override this method and have your implementation return YES.

Content preservation lets your view decide what to redraw during a live resize operation. If your view supports this feature, you should also provide a custom implementation of [setFrameSize:](#) (page 3167) that invalidates the portions of your view that actually need to be redrawn.

For information on how to implement this feature in your views, see *Cocoa Performance Guidelines*.

### Availability

Available in Mac OS X v10.4 and later.

### See Also

- [setFrameSize:](#) (page 3167)

### Declared In

NSView.h

## previousKeyView

Returns the view object preceding the receiver in the key view loop, or nil if there is none.

- (NSView \*)previousKeyView

### Discussion

This view should, if possible, be made first responder when the user navigates backward from the receiver using keyboard interface control.

### Availability

Available in Mac OS X v10.0 and later.

**See Also**

- [previousValidKeyView](#) (page 3145)
- [nextKeyView](#) (page 3140)
- [nextValidKeyView](#) (page 3140)

- [selectNextKeyView:](#) (page 3296) (NSWindow)
- [selectKeyViewFollowingView:](#) (page 3295) (NSWindow)
- [selectPreviousKeyView:](#) (page 3297) (NSWindow)
- [selectKeyViewPrecedingView:](#) (page 3296) (NSWindow)

**Declared In**

NSView.h

**previousValidKeyView**

Returns the closest view object in the key view loop that precedes the receiver and actually accepts first responder status, or `nil` if there is none.

- (NSView \*)previousValidKeyView

**Discussion**

This method ignores hidden views when it determines the previous valid key view.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [previousKeyView](#) (page 3144)
- [nextValidKeyView](#) (page 3140)
- [nextKeyView](#) (page 3140)
- [setNextKeyView:](#) (page 3170)
- [selectNextKeyView:](#) (page 3296) (NSWindow)
- [selectKeyViewFollowingView:](#) (page 3295) (NSWindow)
- [selectPreviousKeyView:](#) (page 3297) (NSWindow)
- [selectKeyViewPrecedingView:](#) (page 3296) (NSWindow)
- [setHidden:](#) (page 3167)

**Declared In**

NSView.h

**print:**

This action method opens the Print panel, and if the user chooses an option other than canceling, prints the receiver and all its subviews to the device specified in the Print panel.

- (void)print:(id)sender

**Parameters***sender*

The object that sent the message.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [dataWithEPSInsideRect:](#) (page 3112)
- [writeEPSInsideRect:toPasteboard:](#) (page 3189)

**Declared In**

NSView.h

**printJobTitle**

Returns the receiver's print job title.

- (NSString \*)printJobTitle

**Discussion**

The default implementation first tries the window's `NSDocument` display name ([displayName](#) (page 944)), then the window's title.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSView.h

**rectForPage:**

Implemented by subclasses to determine the portion of the receiver to be printed for the page number *page*.

- (NSRect)rectForPage:(NSInteger)*pageNumber*

**Parameters***pageNumber*

An integer indicating a page number. Page numbers are one-based—that is pages run from one to *N*.

**Return Value**

A rectangle defining the region of the receiver to be printed for *pageNumber*. This method returns `NSZeroRect` if *pageNumber* is outside the receiver's bounds.

**Discussion**

If the receiver responded YES to an earlier [knowsPageRange:](#) (page 3134) message, this method is invoked for each page it specified in the out parameters of that message. The receiver is later made to display this rectangle in order to generate the image for this page.

If an `NSView` object responds NO to [knowsPageRange:](#) (page 3134), this method isn't invoked by the printing mechanism.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [adjustPageHeightNew:top:bottom:limit:](#) (page 3096)
- [adjustPageWidthNew:left:right:limit:](#) (page 3097)

**Declared In**

NSView.h

**rectPreservedDuringLiveResize**

Returns the rectangle identifying the portion of your view that did not change during a live resize operation.

- (NSRect)rectPreservedDuringLiveResize

**Discussion**

The returned rectangle is in the coordinate system of your view and reflects the space your view previously occupied. This rectangle may be smaller or the same size as your view's current bounds, depending on whether the view grew or shrunk.

If your view does not support content preservation during live resizing, the returned rectangle will be empty. To support content preservation, override [preservesContentDuringLiveResize](#) (page 3144) in your view and have your implementation return YES.

**Note:** The window containing your view must also support content preservation. To enable support for this feature in your window, use the [setPreservesContentDuringLiveResize:](#) (page 3323) method of `NSWindow`.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [getRectsExposedDuringLiveResize:count:](#) (page 3127)
- [preservesContentDuringLiveResize](#) (page 3144)

**Declared In**

NSView.h

**reflectScrolledClipView:**

Notifies a clip view's superview that either the clip view's bounds rectangle or the document view's frame rectangle has changed, and that any indicators of the scroll position need to be adjusted.

- (void)reflectScrolledClipView:(NSClipView \*)aClipView

**Parameters**

*aClipView*

The `NSClipView` object whose superview is to be notified.

**Discussion**

`NSScrollView` implements this method to update its `NSScroller` objects.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSClipView.h`

## registeredDraggedTypes

Returns the array of pasteboard drag types that the view can accept.

- (NSArray \*)registeredDraggedTypes

**Discussion**

This method returns the types registered by calling [registerForDraggedTypes:](#) (page 3148). Each element of the array is a global string constant; see "Constants" for descriptions of the pasteboard string constants. The returned elements are in no particular order, but the array is guaranteed not to contain duplicate entries.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

`NSView.h`

## registerForDraggedTypes:

Registers the pasteboard types that the receiver will accept as the destination of an image-dragging session.

- (void)registerForDraggedTypes:(NSArray \*)*pboardTypes*

**Parameters**

*pboardTypes*

An array of pasteboard types, each a global string constant. See "Constants" for descriptions of the pasteboard string constants.

**Discussion**

Registering an `NSView` object for dragged types automatically makes it a candidate destination object for a dragging session. As such, it must properly implement some or all of the `NSDraggingDestination` protocol methods. As a convenience, `NSView` provides default implementations of these methods. See the `NSDraggingDestination` protocol specification for details.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [registeredDraggedTypes](#) (page 3148)
- [unregisterDraggedTypes](#) (page 3180)

**Declared In**

`NSView.h`

## releaseGState

Frees the receiver's graphics state object, if it has one.

- (void)releaseGState

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [allocateGState](#) (page 3098)

### Declared In

NSView.h

## removeAllToolTips

Removes all tool tips assigned to the receiver.

- (void)removeAllToolTips

### Discussion

This method operates on tool tips created using either [addToolTipRect:owner:userData:](#) (page 3094) or [setToolTip:](#) (page 3173).

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

NSView.h

## removeCursorRect:cursor:

Completely removes a cursor rectangle from the receiver.

- (void)removeCursorRect:(NSRect)aRect cursor:(NSCursor \*)aCursor

### Parameters

*aRect*

A rectangle defining a region of the receiver. Must match a value previously specified using [addCursorRect:cursor:](#) (page 3092).

*aCursor*

An object representing a cursor. Must match a value previously specified using [addCursorRect:cursor:](#) (page 3092).

### Discussion

You should rarely need to use this method. [resetCursorRects](#) (page 3153), which is invoked any time cursor rectangles need to be rebuilt, should establish only the cursor rectangles needed. If you implement [resetCursorRects](#) (page 3153) in this way, you can then simply modify the state that [resetCursorRects](#) (page 3153) uses to build its cursor rectangles and then invoke the `NSWindow` method [invalidateCursorRectsForView:](#) (page 3269).

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [discardCursorRects](#) (page 3114)

**Declared In**

NSView.h

## removeFromSuperview

Unlinks the receiver from its superview and its window, removes it from the responder chain, and invalidates its cursor rectangles.

- (void)removeFromSuperview

**Discussion**

The receiver is also released; if you plan to reuse it, be sure to retain it before sending this message and to release it as appropriate when adding it as a subview of another `NSView`.

Never invoke this method during display.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [addSubview:](#) (page 3092)
- [addSubview:positioned:relativeTo:](#) (page 3093)
- [removeFromSuperviewWithoutNeedingDisplay](#) (page 3150)

**Related Sample Code**

FancyAbout

GLChildWindowDemo

Quartz Composer WWDC 2005 TextEdit

Sketch-112

TextEditPlus

**Declared In**

NSView.h

## removeFromSuperviewWithoutNeedingDisplay

Unlinks the receiver from its superview and its window and removes it from the responder chain, but does not invalidate its cursor rectangles to cause redrawing.

- (void)removeFromSuperviewWithoutNeedingDisplay

**Discussion**

The receiver is also released; if you plan to reuse it, be sure to retain it before sending this message and to release it as appropriate when adding it as a subview of another view.

Unlike its counterpart, [removeFromSuperview](#) (page 3150), this method can be safely invoked during display.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [addSubview:](#) (page 3092)
- [addSubview:positioned:relativeTo:](#) (page 3093)

**Related Sample Code**

CoreRecipes

**Declared In**

NSView.h

**removeToolTip:**

Removes the tool tip identified by specified tag.

```
- (void)removeToolTip:(NSToolTipTag)tag
```

**Parameters**

*tag*

An integer tag that is the value returned by a previous [addToolTipRect:owner:userData:](#) (page 3094) message.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSView.h

**removeTrackingArea:**

Removes a given tracking area from the receiver.

```
- (void)removeTrackingArea:(NSTrackingArea *)trackingArea
```

**Parameters**

*trackingArea*

The tracking area to remove from the receiver.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSView.h

**removeTrackingRect:**

Removes the tracking rectangle identified by a tag.

```
- (void)removeTrackingRect:(NSTrackingRectTag)aTag
```

**Parameters***aTag*

An integer value identifying a tracking rectangle. It was returned by a previously sent [addTrackingRect:owner:userData:assumeInside:](#) (page 3095) message.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [addTrackingRect:owner:userData:assumeInside:](#) (page 3095)
- [removeTrackingArea:](#) (page 3151)

**Declared In**

NSView.h

**renewGState**

Invalidates the receiver's graphics state object, if it has one.

- (void)renewGState

**Discussion**

The receiver's graphics state object will be regenerated using [setUpGState](#) (page 3173) the next time the receiver is focused for drawing

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [lockFocus](#) (page 3135)

**Related Sample Code**

GLSLShowpiece

VideoViewer

**Declared In**

NSView.h

**replaceSubview:with:**

Replaces one of the receiver's subviews with another view.

- (void)replaceSubview:(NSView \*)oldView with:(NSView \*)newView

**Parameters***oldView*

The view to be replaced by *newView*. May not be nil.

*newView*

The view to replace *oldView*. May not be nil.

**Discussion**

This method does nothing if *oldView* is not a subview of the receiver.

Neither *oldView* nor *newView* may be `nil`, and the behavior is undefined if either of these parameters is `nil`.

This method causes *oldView* to be released; if you plan to reuse it, be sure to retain it before sending this message and to release it as appropriate when adding it as a subview of another `NSView`.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [addSubview:](#) (page 3092)
- [addSubview:positioned:relativeTo:](#) (page 3093)

**Declared In**

`NSView.h`

## resetCursorRects

Overridden by subclasses to define their default cursor rectangles.

- (void)resetCursorRects

**Discussion**

A subclass's implementation must invoke [addCursorRect:cursor:](#) (page 3092) for each cursor rectangle it wants to establish. The default implementation does nothing.

Application code should never invoke this method directly; it's invoked automatically as described in "Handling Tracking-Rectangle and Cursor-Update Events in Views." Use the [invalidateCursorRectsForView:](#) (page 3269) method instead to explicitly rebuild cursor rectangles.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [visibleRect](#) (page 3186)

**Related Sample Code**

[TextLinks](#)

**Declared In**

`NSView.h`

## resizeSubviewsWithOldSize:

Informs the receiver's subviews that the receiver's bounds rectangle size has changed.

- (void)resizeSubviewsWithOldSize:(`NSSize`)oldBoundsSize

**Parameters**

*oldBoundsSize*

The previous size of the receiver's bounds rectangle.

**Discussion**

If the receiver is configured to autosize its subviews, this method is automatically invoked by any method that changes the receiver's frame size.

The default implementation sends [resizeWithOldSuperviewSize:](#) (page 3154) to the receiver's subviews with *oldBoundsSize* as the argument. You shouldn't invoke this method directly, but you can override it to define a specific retiling behavior.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [setAutoresizesSubviews:](#) (page 3158)

**Declared In**

NSView.h

**resizeWithOldSuperviewSize:**

Informs the receiver that the bounds size of its superview has changed.

```
– (void)resizeWithOldSuperviewSize:(NSSize)oldBoundsSize
```

**Parameters**

*oldBoundsSize*

The previous size of the superview's bounds rectangle.

**Discussion**

This method is normally invoked automatically from [resizeSubviewsWithOldSize:](#) (page 3153).

The default implementation resizes the receiver according to the autosizing options listed under the [setAutoresizingMask:](#) (page 3159) method description. You shouldn't invoke this method directly, but you can override it to define a specific resizing behavior.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSView.h

**rotateByAngle:**

Rotates the receiver's bounds rectangle by a specified degree value around the origin of the coordinate system, (0.0, 0.0).

```
– (void)rotateByAngle:(CGFloat)angle
```

**Parameters**

*angle*

A `float` value specifying the angle of rotation, in degrees.

**Discussion**

See the [setBoundsRotation:](#) (page 3161) method description for more information. This method neither redisplay the receiver nor marks it as needing display. You must do this yourself with [display](#) (page 3114) or [setNeedsDisplay:](#) (page 3169).

This method posts an [NSViewBoundsDidChangeNotification](#) (page 3193) to the default notification center if the receiver is configured to do so.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setFrameRotation:](#) (page 3166)
- [setPostsBoundsChangedNotifications:](#) (page 3170)

**Declared In**

NSView.h

**scaleUnitSquareToSize:**

Scales the receiver's coordinate system so that the unit square scales to the specified dimensions.

```
- (void)scaleUnitSquareToSize:(NSSize)newUnitSize
```

**Parameters**

*newUnitSize*

An `NSSize` structure specifying the new unit size.

**Discussion**

For example, a *newUnitSize* of (0.5, 1.0) causes the receiver's horizontal coordinates to be halved, in turn doubling the width of its bounds rectangle. Note that scaling is performed from the origin of the coordinate system, (0.0, 0.0), not the origin of the bounds rectangle; as a result, both the origin and size of the bounds rectangle are changed. The frame rectangle remains unchanged.

This method neither redisplay the receiver nor marks it as needing display. You must do this yourself with [display](#) (page 3114) or [setNeedsDisplay:](#) (page 3169).

This method posts an [NSViewBoundsDidChangeNotification](#) (page 3193) to the default notification center if the receiver is configured to do so.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setBoundsSize:](#) (page 3162)
- [setPostsBoundsChangedNotifications:](#) (page 3170)

**Declared In**

NSView.h

**scrollClipViewToPoint:**

Notifies the superview of a clip view that the clip view needs to reset the origin of its bounds rectangle.

```
- (void)scrollClipView:(NSClipView *)aClipView toPoint:(NSPoint)newOrigin
```

**Parameters**

*aClipView*

The NSClipView object whose superview is to be notified.

*newOrigin*

A point that specifies the new origin of the clip view's bounds rectangle.

**Discussion**

The superview of *aClipView* should then send a [scrollToPoint:](#) (page 637) message to *aClipView* with *newOrigin* as the argument. This mechanism is provided so the NSClipView object's superview can coordinate scrolling of multiple tiled clip views.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [scrollToPoint:](#) (page 637) (NSClipView)

**Declared In**

NSClipView.h

**scrollToPoint:**

Scrolls the receiver's closest ancestor NSClipView object so a point in the receiver lies at the origin of the clip view's bounds rectangle.

```
- (void)scrollToPoint:(NSPoint)aPoint
```

**Parameters**

*aPoint*

The point in the receiver to scroll to.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [autoscroll:](#) (page 3100)

- [scrollToPoint:](#) (page 637) (NSClipView)

- [isDescendantOf:](#) (page 3130)

**Declared In**

NSView.h

**scrollRect:by:**

Copies the visible portion of the receiver's rendered image within a region and lays that portion down again at a specified offset .

```
- (void)scrollRect:(NSRect)aRect by:(NSSize)offset
```

**Parameters***aRect*

A rectangle defining a region of the receiver.

*offset*A `NSSize` structure that specifies an offset from *aRect*'s origin.**Discussion**

This method is useful during scrolling or translation of the coordinate system to efficiently move as much of the receiver's rendered image as possible without requiring it to be redrawn, following these steps:

1. Invoke `scrollRect:by:` (page 3156) to copy the rendered image.
2. Move the view object's origin or scroll it within its superview.
3. Calculate the newly exposed rectangles and invoke either `setNeedsDisplay:` (page 3169) or `setNeedsDisplayInRect:` (page 3169) to draw them.

You should rarely need to use this method, however. The `scrollToPoint:` (page 3156), `scrollRectToVisible:` (page 3157), and `autoscroll:` (page 3100) methods automatically perform optimized scrolling.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- `setBoundsOrigin:` (page 3160)
- `translateOriginToPoint:` (page 3178)

**Declared In**

NSView.h

**scrollRectToVisible:**

Scrolls the receiver's closest ancestor `NSClipView` object the minimum distance needed so a specified region of the receiver becomes visible in the clip view.

```
-(BOOL)scrollRectToVisible:(NSRect)aRect
```

**Parameters***aRect*

The rectangle to be made visible in the clip view.

**Discussion**

YES if any scrolling is performed; otherwise returns NO.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- `autoscroll:` (page 3100)
- `scrollToPoint:` (page 637) (`NSClipView`)
- `isDescendantOf:` (page 3130)

**Related Sample Code**

Quartz Composer WWDC 2005 TextEdit

TextEditPlus

**Declared In**

NSView.h

**setAlphaValue:**

Sets the opacity of the receiver.

```
- (void)setAlphaValue:(CGFloat)viewAlpha
```

**Parameters***viewAlpha*

The desired opacity of the receiver.

**Discussion**

This method sets the value of the `opacity` property of the receiver's layer. Possible values are between 0.0 (transparent) and 1.0 (opaque). The default is 1.0.

Sending this message to a view that is not managing a Core Animation layer causes an exception.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSView.h

**setAutoresizesSubviews:**

Determines whether the receiver automatically resizes its subviews when its frame size changes.

```
- (void)setAutoresizesSubviews:(BOOL)flag
```

**Parameters***flag*

If YES, the receiver invokes [resizeSubviewsWithOldSize:](#) (page 3153) whenever its frame size changes; if NO, it doesn't.

**Discussion**

View objects do autoresize their subviews by default.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

NSView.h

## setAutoresizingMask:

Determines how the receiver's [resizeWithOldSuperviewSize:](#) (page 3154) method changes its frame rectangle.

- (void)setAutoresizingMask:(NSUInteger)*mask*

### Parameters

*mask*

An integer bit mask. *mask* can be specified by combining using the C bitwise OR operator any of the options described in “[Resizing masks](#)” (page 3190).

### Discussion

Where more than one option along an axis is set, [resizeWithOldSuperviewSize:](#) (page 3154) by default distributes the size difference as evenly as possible among the flexible portions. For example, if `NSViewWidthSizable` and `NSViewMaxXMargin` are set and the superview's width has increased by 10.0 units, the receiver's frame and right margin are each widened by 5.0 units.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [autoresizingMask](#) (page 3100)
- [resizeSubviewsWithOldSize:](#) (page 3153)

## setBackgroundFilters:

An array of CoreImage filters that are applied to the receiver's background.

- (void)setBackgroundFilters:(NSArray \*)*filters*

### Parameters

*filters*

An array of CoreImage filters.

### Discussion

This method sets the value of the `backgroundFilters` property of the receiver's layer.

Sending this message to a view that is not managing a Core Animation layer causes an exception.

### Availability

Available in Mac OS X v10.5 and later.

**Declared In**

NSView.h

**setBounds:**

Sets the receiver's bounds rectangle.

- (void)setBounds:(NSRect)boundsRect

**Parameters**

*boundsRect*

A rectangle defining the new bounds of the receiver.

**Discussion**

The bounds rectangle determines the origin and scale of the receiver's coordinate system within its frame rectangle. This method neither redisplay the receiver nor marks it as needing display. You must do this yourself with [display](#) (page 3114) or [setNeedsDisplay:](#) (page 3169).

This method posts an [NSViewBoundsDidChangeNotification](#) (page 3193) to the default notification center if the receiver is configured to do so.

After calling this method, `NSView` creates an internal transform (or appends these changes to an existing internal transform) to convert from frame coordinates to bounds coordinates in your view. As long as the width-to-height ratio of the two coordinate systems remains the same, your content appears normal. If the ratios differ, your content may appear skewed.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [bounds](#) (page 3102)

- [setFrame:](#) (page 3164)
- [setPostsBoundsChangedNotifications:](#) (page 3170)

**Declared In**

NSView.h

**setBoundsOrigin:**

Sets the origin of the receiver's bounds rectangle to a specified point,

- (void)setBoundsOrigin:(NSPoint)newOrigin

**Parameters**

*newOrigin*

A point specifying the new bounds origin of the receiver.

**Discussion**

In setting the new bounds origin, this method effectively shifts the receiver's coordinate system so *newOrigin* lies at the origin of the receiver's frame rectangle. It neither redisplay the receiver nor marks it as needing display. You must do this yourself with `display` or `setNeedsDisplay:` (page 3169).

This method posts an `NSViewBoundsDidChangeNotification` (page 3193) to the default notification center if the receiver is configured to do so.

After calling this method, `NSView` creates an internal transform (or appends these changes to an existing internal transform) to convert from frame coordinates to bounds coordinates in your view. As long as the width-to-height ratio of the two coordinate systems remains the same, your content appears normal. If the ratios differ, your content may appear skewed.

**Availability**

Available in Mac OS X v10.0 and later.

**Related Sample Code**

Polygons

**Declared In**

`NSView.h`

**setBoundsRotation:**

Sets the rotation of the receiver's bounds rectangle to a specific degree value.

```
- (void)setBoundsRotation:(CGFloat)angle
```

**Parameters**

*angle*

A `float` value specifying the angle of rotation, in degrees.

**Discussion**

Positive values indicate counterclockwise rotation, negative clockwise. Rotation is performed around the coordinate system origin, (0.0, 0.0), which need not coincide with that of the frame rectangle or the bounds rectangle. This method neither redisplay the receiver nor marks it as needing display. You must do this yourself with `display` (page 3114) or `setNeedsDisplay:` (page 3169).

This method posts an `NSViewBoundsDidChangeNotification` (page 3193) to the default notification center if the receiver is configured to do so.

Bounds rotation affects the orientation of the drawing within the view object's frame rectangle, but not the orientation of the frame rectangle itself. Also, for a rotated bounds rectangle to enclose all the visible areas of its view object—that is, to guarantee coverage over the frame rectangle—it must also contain some areas

that aren't visible. This can cause unnecessary drawing to be requested, which may affect performance. It may be better in many cases to rotate the coordinate system in the [drawRect:](#) (page 3121) method rather than use this method.

After calling this method, `NSView` creates an internal transform (or appends these changes to an existing internal transform) to convert from frame coordinates to bounds coordinates in your view. As long as the width-to-height ratio of the two coordinate systems remains the same, your content appears normal. If the ratios differ, your content may appear skewed.

#### Availability

Available in Mac OS X v10.0 and later.

#### Declared In

`NSView.h`

## setBoundsSize:

Sets the size of the receiver's bounds rectangle to specified dimensions, inversely scaling its coordinate system relative to its frame rectangle.

```
- (void)setBoundsSize:(NSSize)newSize
```

#### Parameters

*newSize*

An `NSSize` structure specifying the new width and height of the receiver's bounds rectangle.

#### Discussion

For example, a view object with a frame size of (100.0, 100.0) and a bounds size of (200.0, 100.0) draws half as wide along the x axis. This method neither redisplay the receiver nor marks it as needing display. You must do this yourself with [display](#) (page 3114) or [setNeedsDisplay:](#) (page 3169).

This method posts an [NSViewBoundsDidChangeNotification](#) (page 3193) to the default notification center if the receiver is configured to do so.

After calling this method, `NSView` creates an internal transform (or appends these changes to an existing internal transform) to convert from frame coordinates to bounds coordinates in your view. As long as the width-to-height ratio of the two coordinate systems remains the same, your content appears normal. If the ratios differ, your content may appear skewed.

#### Availability

Available in Mac OS X v10.0 and later.

**setCompositingFilter:**

Sets a CoreImage filter that is used to composite the receiver’s contents with the background.

– (void)setCompositingFilter:(CIFilter \*)*filter*

**Parameters**

*filter*

A CoreImage filter.

**Discussion**

This method sets the value of the [compositingFilter](#) (page 3106) property of the receiver’s layer.

Sending this message to a view that is not managing a Core Animation layer causes an exception.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSView.h

**setContentFilters:**

Sets the array of CoreImage filters that are applied to the contents of the receiver and its sublayers.

– (void)setContentFilters:(NSArray \*)*filters*

**Parameters**

*filters*

An array of CoreImage filters.

**Discussion**

This method sets the value of the *filters* property of the receiver’s layer.

Sending this message to a view that is not managing a Core Animation layer causes an exception.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSView.h

## setFocusRingType:

Sets the type of focus ring to be drawn around the receiver.

- (void)setFocusRingType:(NSFocusRingType) *focusRingType*

### Parameters

*focusRingType*

An enum constant identifying a type of focus ring. Possible values are listed in [NSFocusRingType](#) (page 3705). You can specify `NSFocusRingTypeNone` to indicate you do not want your view to have a focus ring.

### Discussion

This method only sets the desired focus ring type and does not cause the view to draw the actual focus ring. You are responsible for drawing the focus ring in your view's [drawRect:](#) (page 3121) method whenever your view is made the first responder.

### Availability

Available in Mac OS X v10.3 and later.

### See Also

- [focusRingType](#) (page 3125)

### Declared In

NSView.h

## setFrame:

Sets the receiver's frame rectangle to the specified rectangle.

- (void)setFrame:(NSRect) *frameRect*

### Parameters

*frameRect*

The new frame rectangle for the view.

### Discussion

This method, in setting the frame rectangle, repositions and resizes the receiver within the coordinate system of its superview. It neither redisplay the receiver nor marks it as needing display. You must do this yourself with [display](#) (page 3114) or [setNeedsDisplay:](#) (page 3169).

This method posts an [NSViewFrameDidChangeNotification](#) (page 3194) to the default notification center if the receiver is configured to do so.

If your view does not use a custom bounds rectangle, this method also sets your view bounds to match the size of the new frame. You specify a custom bounds rectangle by calling [setBounds:](#) (page 3160), [setBoundsOrigin:](#) (page 3160), [setBoundsRotation:](#) (page 3161), or [setBoundsSize:](#) (page 3162) explicitly. Once set, NSView creates an internal transform to convert from frame coordinates to bounds coordinates. As long as the width-to-height ratio of the two coordinate systems remains the same, your content appears normal. If the ratios differ, your content may appear skewed.

### Availability

Available in Mac OS X v10.0 and later.

NSView.h

**setFrameCenterRotation:**

Rotates the frame of the receiver about the layer's position.

```
- (void)setFrameCenterRotation:(CGFloat)angle
```

**Parameters***angle*

The angle to rotate the frame around the center of the receiver.

**Discussion**

If the application has altered the layer's `anchorPoint` property, the behavior is undefined. Sending this message to a view that is not managing a Core Animation layer causes an exception.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSView.h

**setFrameOrigin:**

Sets the origin of the receiver's frame rectangle to the specified point, effectively repositioning it within its superview.

```
- (void)setFrameOrigin:(NSPoint)newOrigin
```

**Parameters***newOrigin*

The point that is the new origin of the receiver's frame.

**Discussion**

This method neither redisplay the receiver nor marks it as needing display. You must do this yourself with [display](#) (page 3114) or [setNeedsDisplay:](#) (page 3169).

This method posts an [NSNotification](#) (page 3194) to the default notification center if the receiver is configured to do so.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [frame](#) (page 3125)

NSView.h

## setSize:

Sets the size of the receiver's frame rectangle to the specified dimensions, resizing it within its superview without affecting its coordinate system.

```
- (void)setFrameSize:(NSSize)newSize
```

### Parameters

*newSize*

An `NSSize` structure specifying the new height and width of the frame rectangle.

### Discussion

This method neither redisplay the receiver nor marks it as needing display. You must do this yourself with [display](#) (page 3114) or [setNeedsDisplay:](#) (page 3169).

This method posts an [NSViewFrameDidChangeNotification](#) (page 3194) to the default notification center if the receiver is configured to do so.

In Mac OS X version 10.4 and later, you can override this method to support content preservation during live resizing. In your overridden implementation, include some conditional code to be executed only during a live resize operation. Your code must invalidate any portions of your view that need to be redrawn.

### Availability

Available in Mac OS X v10.0 and later.

NSView.h

## setHidden:

Sets whether the receiver is hidden.

```
- (void)setHidden:(BOOL)flag
```

### Parameters

*flag*

YES if the receiver is to be hidden, NO otherwise.

**Discussion**

A hidden view disappears from its window and does not receive input events. It remains in its superview's list of subviews, however, and participates in autosizing as usual. The Application Kit also disables any cursor rectangle, tool-tip rectangle, or tracking rectangle associated with a hidden view. Hiding a view with subviews has the effect of hiding those subviews and any view descendants they might have. This effect is implicit and does not alter the hidden state of the receiver's descendants as reported by `isHidden` (page 3131).

Hiding the view that is the window's current first responder causes the view's next valid key view (`nextValidKeyView` (page 3140)) to become the new first responder. A hidden view remains in the `nextKeyView` (page 3140) chain of views it was previously part of, but is ignored during keyboard navigation.

**Availability**

Available in Mac OS X v10.3 and later.

**See Also**

- `isHidden` (page 3131)
- `isHiddenOrHasHiddenAncestor` (page 3132)

**setKeyboardFocusRingNeedsDisplayInRect:**

Invalidates the area around the focus ring.

```
- (void)setKeyboardFocusRingNeedsDisplayInRect:(NSRect)rect
```

**Parameters**

*rect*

The rectangle of the control or cell defining the area around the focus ring. *rect* will be expanded to include the focus ring for invalidation.

**Availability**

Available in Mac OS X v10.1 and later.

**Declared In**

NSView.h

**setLayer:**

Sets the Core Animation layer that the receiver uses for layer-backing to the specified layer.

```
- (void)setLayer:(CALayer *)newLayer
```

**Parameters***newLayer*

A Core Animation layer to use as the receiver's backing store.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSView.h

**setNeedsDisplay:**

Controls whether the receiver's entire bounds is marked as needing display.

- (void)setNeedsDisplay:(BOOL)*flag*

**Parameters***flag*

If YES, marks the receiver's entire bounds as needing display; if NO, marks it as not needing display.

**Discussion**

Whenever the data or state used for drawing a view object changes, the view should be sent a `setNeedsDisplay:` message. `NSView` objects marked as needing display are automatically redisplayed on each pass through the application's event loop. (View objects that need to redisplay before the event loop comes around can of course immediately be sent the appropriate `display...` method.)

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setNeedsDisplayInRect:](#) (page 3169)
- [needsDisplay](#) (page 3139)

**Related Sample Code**

**Declared In**

NSView.h

**setPostsBoundsChangedNotifications:**

Controls whether the receiver informs observers when its bounds rectangle changes.

- (void)setPostsBoundsChangedNotifications:(BOOL) *flag*

**Parameters***flag*

If YES, the receiver will post notifications to the default notification center whenever its bounds rectangle changes; if *flag* is NO it won't.

**Discussion**

Note that if *flag* is YES and bounds notifications are suppressed, when the bounds change notification is reenabled the view will immediately post a single such notification if its bounds changed during this time. This will happen even if there has been no net change in the view's bounds.

The following methods can result in notification posting:

[setBounds:](#) (page 3160)  
[setBoundsOrigin:](#) (page 3160)  
[setBoundsRotation:](#) (page 3161)  
[setBoundsSize:](#) (page 3162)  
[translateOriginToPoint:](#) (page 3178)  
[scaleUnitSquareToSize:](#) (page 3155)  
[rotateByAngle:](#) (page 3154)

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [postsBoundsChangedNotifications](#) (page 3143)

**Declared In**

NSView.h

**setPostsFrameChangedNotifications:**

Controls whether the receiver informs observers when its frame rectangle changes.

- (void)setPostsFrameChangedNotifications:(BOOL)*flag*

**Parameters***flag*

If YES, the receiver will post notifications to the default notification center whenever its frame rectangle changes; if *flag* is NO it won't.

**Discussion**

Note that if *flag* is YES and frame notifications are suppressed, when the frame change notification is reenabled the view will immediately post a single such notification if its frame changed during this time. This will happen even if there has been no net change in the view's frame.

The following methods can result in notification posting:

[setFrame:](#) (page 3164)  
[setFrameOrigin:](#) (page 3165)  
[setFrameRotation:](#) (page 3166)  
[setFrameSize:](#) (page 3167)

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [postsFrameChangedNotifications](#) (page 3144)

**Declared In**

NSView.h

**setShadow:**

Sets the shadow drawn by the receiver.

- (void)setShadow:(NSShadow \*)*shadow*

**Parameters**

*shadow*

An instance of NSShadow.

**Discussion**

This method sets the `shadowColor`, `shadowOffset`, `shadowOpacity` and `shadowRadius` properties of the receiver's layer.

Sending this message to a view that is not managing a Core Animation layer causes an exception.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSView.h

**setSubviews:**

Sets the receiver's subviews to the specified subviews.

- (void)setSubviews:(NSArray \*)*newSubviews*

**Parameters**

*newSubviews*

An array of subviews. The *newSubviews* array can consist of existing subviews of the receiver or other views that have `nil` as their superview. If *newSubviews* is `nil`, or contains duplicated views, or if any of its members have a superview other than `nil` or the receiver, an invalid argument exception is thrown.

**Discussion**

Using this method you can: reorder the receiver's existing subviews, add or remove subviews en masse, replace all of the receiver's subviews with a new set of subviews, or remove all the receiver's subviews.

Given a valid array of views in *newSubviews*, [setSubviews:](#) (page 3172) performs any required sorting of the subviews array, as well as sending any [addSubview:](#) (page 3092) and [removeFromSuperview](#) (page 3150) messages as necessary to leave the receiver with the requested new array of subviews. Any member of

*newSubviews* that isn't already a subview of the receiver is added. Any member of the view's existing *subviews* array that isn't in *newSubviews* is removed. And any views that are in both *subviews* (page 3176) and *newSubviews* are moved in the *subviews* array as needed, without being removed and re-added.

This method marks the affected view and window areas as needing display.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSView.h

## setToolTip:

Sets the tool tip text for the view to *string*.

```
- (void)setToolTip:(NSString *)string
```

**Parameters**

*string*

A string that contains the text to use for the tool tip. If *nil*, it cancels tool tip display for the view.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [toolTip](#) (page 3178)

**Declared In**

NSView.h

## setUpGState

Overridden by subclasses to (re)initialize the receiver's graphics state object.

```
- (void)setUpGState
```

**Discussion**

This method is automatically invoked when the graphics state object created using [allocateGState](#) (page 3098) needs to be initialized. The default implementation does nothing. Your subclass can override it to set the current font, line width, or any other graphics state parameter except coordinate transformations and the clipping path—these are established by the frame and bounds rectangles and by methods such as [scaleUnitSquareToSize:](#) (page 3155) and [translateOriginToPoint:](#) (page 3178). Note that [drawRect:](#) can further transform the coordinate system and clipping path for whatever temporary effects it needs.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [allocateGState](#) (page 3098)

- [renewGState](#) (page 3152)

**Declared In**

NSView.h

**setWantsLayer:**

Specifies whether the receiver and its subviews use a Core Animation layer as a backing store.

- (void)setWantsLayer:(BOOL)*flag*

**Parameters**

*flag*

YES if the receiver and its subviews should use a Core Animation layer as its backing store, otherwise NO.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSView.h

**shadow**

Returns the shadow drawn by the receiver

- (NSShadow \*)shadow

**Return Value**

An instance of NSShadow that is created using the `shadowColor`, `shadowOffset`, `shadowOpacity` and `shadowRadius` properties of the receiver's layer.

**Discussion**

Sending this message to a view that is not managing a Core Animation layer causes an exception.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSView.h

**shouldDelayWindowOrderingForEvent:**

Overridden by subclasses to allow the user to drag images from the receiver without its window moving forward and possibly obscuring the destination and without activating the application.

- (BOOL)shouldDelayWindowOrderingForEvent:(NSEvent \*)*theEvent*

**Parameters**

*theEvent*

An object representing an initial mouse-down event.

**Return Value**

If this method returns YES, the normal window-ordering and activation mechanism is delayed (not necessarily prevented) until the next mouse-up event. If it returns NO, then normal ordering and activation occur.

**Discussion**

Never invoke this method directly; it's invoked automatically for each mouse-down event directed at the `NSView`.

An `NSView` subclass that allows dragging should implement this method to return `YES` if *theEvent* is potentially the beginning of a dragging session or of some other context where window ordering isn't appropriate. This method is invoked before a `mouseDown:` (page 2133) message for *theEvent* is sent. The default implementation returns `NO`.

If, after delaying window ordering, the receiver actually initiates a dragging session or similar operation, it should also send a `preventWindowOrdering` (page 160) message to `NSApp`, which completely prevents the window from ordering forward and the activation from becoming active. `preventWindowOrdering` (page 160) is sent automatically by the `NSView` `dragImage:...` and `dragFile:...` methods.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSView.h`

**shouldDrawColor**

Returns `NO` if the receiver is being drawn in an `NSWindow` object (as opposed, for example, to being printed) and the window object can't store color; otherwise returns `YES`.

- (BOOL)shouldDrawColor

**Discussion**

A view object can base its drawing behavior on the return value of this method to improve its appearance in grayscale windows.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- `drawRect:` (page 3121)
- `canStoreColor` (page 3241) (`NSWindow`)

**Declared In**

`NSView.h`

**sortSubviewsUsingFunction:context:**

Orders the receiver's immediate subviews using the specified comparator function.

- (void)sortSubviewsUsingFunction:(NSComparisonResult (\*)(id, id, void \*))compare  
context:(void \*)context

**Parameters***compare*

A pointer to the comparator function. This function must take as arguments two subviews to be ordered and contextual data (supplied in *context* which may be arbitrary data used to help in the comparison. The comparator function should return `NSOrderedAscending` if the first subview should be ordered lower, `NSOrderedDescending` if the second subview should be ordered lower, and `NSOrderedSame` if their ordering isn't important.

*context*

Arbitrary data that might help the comparator function `compare` in its decisions.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

`sortedArrayUsingFunction:context:` (NSArray)

**Declared In**

NSView.h

**subviews**

Return the receiver's immediate subviews.

- (NSArray \*)subviews

**Return Value**

Returns an array containing the receiver's subviews.

**Discussion**

The order of the subviews may be considered as being back-to-front, but this does not imply invalidation and drawing behavior. The order is based on the order of the receiver's subviews as specified in the nib file from which they were unarchived or the programmatic interface for modifying the receiver's subview list. This ordering is also the reverse of the order in which hit-testing is done.

**Note:** The contents of this array may change at any time. If you intend to manipulate this array you should copy it rather than simply retain.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [Superview](#) (page 3177)

**toolTip**

Returns the text for the view's tool tip.

- (NSString \*)toolTip

**Return Value**

The tool tip text or `nil` if the view doesn't currently display tool tip text

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setToolTip:](#) (page 3173)

**Declared In**

NSView.h

**trackingAreas**

Returns an array of the receiver's tracking areas.

- (NSArray \*)trackingAreas

**Return Value**

An array of the receiver's tracking areas (instances of `NSTrackingArea`). If the receiver has no tracking areas, returns an empty array.

**Availability**

Available in Mac OS X v10.5 and later.

**Related Sample Code**

MenuItemView

**Declared In**

NSView.h

**translateOriginToPoint:**

Translates the receiver's coordinate system so that its origin moves to a new location.

- (void)translateOriginToPoint:(NSPoint)*newOrigin*

**Parameters**

*newOrigin*

A point that specifies the new origin.

**Discussion**

In the process, the origin of the receiver's bounds rectangle is shifted by  $(-newOrigin.x, -newOrigin.y)$ . This method neither redisplay the receiver nor marks it as needing display. You must do this yourself with [display](#) (page 3114) or [setNeedsDisplay:](#) (page 3169).

Note the difference between this method and setting the bounds origin. Translation effectively moves the image inside the bounds rectangle, while setting the bounds origin effectively moves the rectangle over the image. The two are in a sense inverse, although translation is cumulative, and setting the bounds origin is absolute.

This method posts an [NSViewBoundsDidChangeNotification](#) (page 3193) to the default notification center if the receiver is configured to do so.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setPostsBoundsChangedNotifications:](#) (page 3170)

**Related Sample Code**

Polygons

**Declared In**

NSView.h

**translateRectsNeedingDisplayInRect:by:**

Translates the display rectangles by the specified delta.

```
- (void)translateRectsNeedingDisplayInRect:(NSRect)clipRectby:(NSSize)delta
```

**Parameters**

*clipRect*

A rectangle defining the region of the receiver, typically the receiver's bounds.

*delta*

A NSSize structure that specifies an offset from from aRect's origin.

**Discussion**

The method is similar to the `scrollRect:by:` method:

1. It collects the receiving view's dirty rectangles.
2. Clears all dirty rectangles in the intersection of *clipRect* and the view's bounds.
3. Shifts the retrieved rectangles by the *delta* offset.
4. Clips the result to the intersection of *clipRect* and the view's bounds
5. Draws the resultant rectangles in the view.

The developer must ensure that *clipRect* and *delta* are pixel-aligned in order to guarantee correct drawing. See View Coordinate Conversion in *View Programming Guide for Cocoa* for a description of how to pixel-align view coordinates.

**Note:** In most cases developers should use the [scrollRect:by:](#) (page 3156) method instead.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSView.h

## unlockFocus

Balances an earlier [lockFocus](#) (page 3135) or [lockFocusIfCanDraw](#) (page 3136) message; restoring the focus to the previously focused view is necessary.

- (void)unlockFocus

**Discussion**

Raises an `NSInvalidArgumentException` if invoked on the wrong view.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

## unregisterDraggedTypes

Unregisters the receiver as a possible destination in a dragging session.

- (void)unregisterDraggedTypes

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [registerForDraggedTypes:](#) (page 3148)

**Declared In**

NSView.h

## updateTrackingAreas

Invoked automatically when the view's geometry changes such that its tracking areas need to be recalculated.

- (void)updateTrackingAreas

### Discussion

You should override this method to remove out of date tracking areas and add recomputed tracking areas; your implementation should call `super`.

### Availability

Available in Mac OS X v10.5 and later.

### Declared In

NSView.h

## viewDidEndLiveResize

Informs the receiver of the end of a live resize.

- (void)viewDidEndLiveResize

### Discussion

In the simple case, a view is sent `viewWillStartLiveResize` (page 3185) before the first resize operation on the containing window and `viewDidEndLiveResize` after the last resize operation. A view that is repeatedly added and removed from a window during live resize will receive only one `viewWillStartLiveResize` (on the first time it is added to the window) and one `viewDidEndLiveResize` (when the window has completed the live resize operation). This allows a superview such as `NSBrowser` object to add and remove its `NSMatrix` subviews during live resize without the `NSMatrix` receiving multiple calls to these methods.

A view might allocate data structures to cache-drawing information in `viewWillStartLiveResize` (page 3185) and should clean up these data structures in `viewDidEndLiveResize`. In addition, a view that does optimized drawing during live resize might want to do full drawing after `viewDidEndLiveResize`, although a view should not assume that it has a drawing context in `viewDidEndLiveResize` (since it may have been removed from the window during live resize). A view that wants to redraw itself after live resize should call `[self setNeedsDisplay:YES]` in `viewDidEndLiveResize`.

A view subclass should call `super` from these methods.

### Availability

Available in Mac OS X v10.1 and later.

### See Also

### Declared In

NSView.h

## viewDidHide

Invoked when the receiver is hidden, either directly, or in response to an ancestor being hidden.

- (void)viewDidHide

### Discussion

The receiver receives this message when its [isHiddenOrHasHiddenAncestor](#) (page 3132) state goes from NO to YES. This will happen when the view or an ancestor is marked as hidden, or when the view or an ancestor is inserted into a new view hierarchy.

### Availability

Available in Mac OS X v10.5 and later.

### Declared In

NSView.h

## viewDidMoveToSuperview

Informs the receiver that its superview has changed (possibly to nil).

- (void)viewDidMoveToSuperview

### Discussion

The default implementation does nothing; subclasses can override this method to perform whatever actions are necessary.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [viewDidMoveToWindow](#) (page 3182)
- [viewWillMoveToSuperview:](#) (page 3184)
- [viewWillMoveToWindow:](#) (page 3184)

### Declared In

NSView.h

## viewDidMoveToWindow

Informs the receiver that it has been added to a new view hierarchy.

- (void)viewDidMoveToWindow

### Discussion

The default implementation does nothing; subclasses can override this method to perform whatever actions are necessary.

[window](#) (page 3188) may return nil when this method is invoked, indicating that the receiver does not currently reside in any window. This occurs when the receiver has just been removed from its superview or when the receiver has just been added to a superview that does not itself have a window. Overrides of this method may choose to ignore such cases if they are not of interest.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [viewDidMoveToSuperview](#) (page 3182)

## viewDidUnhide

Invoked when the receiver is unhidden, either directly, or in response to an ancestor being unhidden

- (void)viewDidUnhide

**Discussion**

The receiver receives this message when its `isHiddenOrHasHiddenAncestor` state goes from YES to NO. This can happen when the view or an ancestor is marked as not hidden, or when the view or an ancestor is removed from its containing view hierarchy.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSView.h

## viewWillDraw

Informs the receiver that it will be required to draw content.

- (void)viewWillDraw

**Discussion**

In response to receiving one of the `display...` messages the receiver will recurse down the view hierarchy, sending this message to each of the views that may be involved in the display operation.

Subclasses can override this method to move or resize views, mark additional areas as requiring display, or other actions that can best be deferred until they are required for drawing. During the recursion, sending of [setNeedsDisplay:](#) (page 3169) and [setNeedsDisplayInRect:](#) (page 3169) messages to views in the hierarchy that's about to be drawn is valid and supported, and will affect the assessment of the total area to be rendered in that drawing pass.

A subclass's implementation of `viewWillDraw` can use the existing `NSView` [getRectsBeingDrawn:count:](#) (page 3126) method to obtain a list of rectangles that bound the affected area, enabling it to restrict its efforts to that area.

The following is an example of a generic subclass implementation:

```
- (void)viewWillDraw {
 // Perform some operations before recursing for descendants.

 // Now recurse to handle all our descendants.
 // Overrides must call up to super like this.
 [super viewWillDraw];

 // Perform some operations that might depend on descendants
 // already having had a chance to update.
}
```

#### Availability

Available in Mac OS X v10.5 and later.

#### Declared In

NSView.h

### viewWillMoveToSuperview:

Informs the receiver that its superview is about to change to the specified superview (which may be `nil`).

```
- (void)viewWillMoveToSuperview:(NSView *)newSuperview
```

#### Parameters

*newSuperview*

A view object that will be the new superview of the receiver.

#### Discussion

Subclasses can override this method to perform whatever actions are necessary.

#### Availability

Available in Mac OS X v10.0 and later.

- [viewDidMoveToWindow](#) (page 3182)
- [viewWillMoveToSuperview:](#) (page 3184)

**Declared In**

NSView.h

**viewWillStartLiveResize**

Informs the receiver of the start of a live resize.

- (void)viewWillStartLiveResize

**Discussion**

In the simple case, a view is sent `viewWillStartLiveResize` before the first resize operation on the containing window and `viewDidEndLiveResize` (page 3181) after the last resize operation. A view that is repeatedly added and removed from a window during live resize will receive only one `viewWillStartLiveResize` (on the first time it is added to the window) and one `viewDidEndLiveResize` (when the window has completed the live resize operation). This allows a superview such as `NSBrowser` object to add and remove its `NSMatrix` subviews during live resize without the `NSMatrix` object receiving multiple calls to these methods.

A view might allocate data structures to cache-drawing information in `viewWillStartLiveResize` and should clean up these data structures in `viewDidEndLiveResize` (page 3181). In addition, a view that does optimized drawing during live resize might want to do full drawing after `viewDidEndLiveResize`, although a view should not assume that it has a drawing context in `viewDidEndLiveResize` (since it may have been removed from the window during live resize). A view that wants to redraw itself after live resize should call `[self setNeedsDisplay:YES]` in `viewDidEndLiveResize`.

A view subclass should call `super` from these methods.

PrefsPane

### Declared In

NSView.h

## visibleRect

Returns the portion of the receiver not clipped by its superviews.

```
- (NSRect)visibleRect
```

### Return Value

A rectangle defining the unclipped portion of the receiver.

### Discussion

Visibility for this method is defined quite simply and doesn't account for whether other `NSView` objects (or windows) overlap the receiver or whether the receiver has a window at all. This method returns `NSZeroRect` if the receiver is effectively hidden.

During a printing operation the visible rectangle is further clipped to the page being imaged.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [setHidden:](#) (page 3167)
- [isVisible](#) (page 3274) (`NSWindow`)

**Declared In**

NSView.h

**wantsDefaultClipping**

Returns whether the Application Kit's default clipping provided to [drawRect:](#) (page 3121) implementations is in effect.

- (BOOL)wantsDefaultClipping

**Return Value**

YES if the default clipping is in effect, NO otherwise. By default, this method returns YES.

**Discussion**

Subclasses may override this method to return NO if they want to suppress the default clipping. They may want to do this in situations where drawing performance is critical to avoid the cost of setting up, enforcing, and cleaning up the clip path

A view that overrides this method to refuse the default clipping must either set up whatever clipping it requires or constrain its drawing exactly to the list of rectangles returned by [getRectsBeingDrawn:count:](#) (page 3126). Failing to do so could result in corruption of other drawing in the view's window.

**Availability**

Available in Mac OS X v10.3 and later.

**Related Sample Code**

VideoViewer

**Declared In**

NSView.h

**wantsLayer**

Returns a Boolean value that indicates whether the receiver is using a layer as its backing store.

- (BOOL)wantsLayer

**Return Value**

YES if the receiver is using a Core Animation layer as its backing store, otherwise NO.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSView.h

**widthAdjustLimit**

Returns the fraction (from 0.0 to 1.0) of the page that can be pushed onto the next page during automatic pagination to prevent items such as small images or text columns from being divided across pages.

- (CGFloat)widthAdjustLimit

**Discussion**

This fraction is used to calculate the right edge limit for a [adjustPageWidthNew:left:right:limit:](#) (page 3097) message.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [heightAdjustLimit](#) (page 3128)

**Declared In**

NSView.h

## willRemoveSubview:

Overridden by subclasses to perform additional actions before subviews are removed from the receiver.

- (void)willRemoveSubview:(NSView \*)*subview*

**Parameters**

*subview*

The subview that will be removed.

**Discussion**

This method is invoked when *subview* receives a [removeFromSuperview](#) (page 3150) message or *subview* is removed from the receiver due to it being added to another view with [addSubview:](#) (page 3092).

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSView.h

## window

Returns the receiver's window object, or nil if it has none.

- (NSWindow \*)window

**Availability**

Available in Mac OS X v10.0 and later.

## Constants

### NSBorderType

These constants specify the type of a view's border.

```
typedef enum _NSBorderType {
 NSNoBorder = 0,
 NSLineBorder = 1,
 NSBezelBorder = 2,
 NSGrooveBorder = 3
} NSBorderType;
```

#### Constants

NSBezelBorder

A concave border that makes the view look sunken.

Available in Mac OS X v10.0 and later.

Declared in `NSView.h`.

NSGrooveBorder

A thin border that looks etched around the image.

Available in Mac OS X v10.0 and later.

Declared in `NSView.h`.

NSLineBorder

A black line border around the view.

Available in Mac OS X v10.0 and later.

Declared in `NSView.h`.

NSNoBorder

No border.

Available in Mac OS X v10.0 and later.

Declared in `NSView.h`.

#### Availability

Available in Mac OS X v10.0 and later.

#### Declared In

`NSView.h`

## Resizing masks

These constants are used by [setAutoresizingMask:](#) (page 3159).

```
enum {
 NSViewNotSizable = 0,
 NSViewMinXMargin = 1,
 NSViewWidthSizable = 2,
 NSViewMaxXMargin = 4,
 NSViewMinYMargin = 8,
 NSViewHeightSizable = 16,
 NSViewMaxYMargin = 32
};
```

**Constants**

`NSViewNotSizable`

The receiver cannot be resized.

Available in Mac OS X v10.0 and later.

Declared in `NSView.h`.

`NSViewMinXMargin`

The left margin between the receiver and its superview is flexible.

Available in Mac OS X v10.0 and later.

Declared in `NSView.h`.

`NSViewWidthSizable`

The receiver's width is flexible.

Available in Mac OS X v10.0 and later.

Declared in `NSView.h`.

`NSViewMaxXMargin`

The right margin between the receiver and its superview is flexible.

Available in Mac OS X v10.0 and later.

Declared in `NSView.h`.

`NSViewMinYMargin`

The bottom margin between the receiver and its superview is flexible.

Available in Mac OS X v10.0 and later.

Declared in `NSView.h`.

`NSViewHeightSizable`

The receiver's height is flexible.

Available in Mac OS X v10.0 and later.

Declared in `NSView.h`.

`NSViewMaxYMargin`

The top margin between the receiver and its superview is flexible.

Available in Mac OS X v10.0 and later.

Declared in `NSView.h`.

**Declared In**

`NSView.h`

**NSToolTipTag**

This type describes the rectangle used to identify a tool tip rectangle.

```
typedef NSInteger NSToolTipTag;
```

**Discussion**

See the methods [addToolTipRect:owner:userData:](#) (page 3094) and [removeToolTip:](#) (page 3151).

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSView.h

**NSTackingRectTag**

This type describes the rectangle used to track the mouse.

```
typedef NSInteger NSTackingRectTag;
```

**Discussion**

See the methods [addTrackingRect:owner:userData:assumeInside:](#) (page 3095) and [removeTrackingRect:](#) (page 3151).

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSView.h

**Full screen mode**

These constants are keys that you can use in the options dictionary in

[enterFullScreenMode:withOptions:](#) (page 3124) and [exitFullScreenModeWithOptions:](#) (page 3124).

```
NSString * const NSFullScreenModeAllScreens;
NSString * const NSFullScreenModeSetting;
NSString * const NSFullScreenModeWindowLevel;
```

**Constants**

`NSFullScreenModeAllScreens`

Key whose corresponding value specifies whether the view should take over all screens.

The corresponding value is an instance of `NSNumber` containing a Boolean value.

Available in Mac OS X v10.5 and later.

Declared in `NSView.h`.

`NSFullScreenModeSetting`

Key whose corresponding value specifies the the full screen mode setting.

The corresponding value is an instance of `NSDictionary` that contains keys specified in `Display Mode Standard Properties` and `Display Mode Optional Properties` in *Quartz Display Services Reference*.

Available in Mac OS X v10.5 and later.

Declared in `NSView.h`.

`NSFullScreenModeWindowLevel`

Key whose corresponding value specifies the screen mode window level.

The corresponding value is an instance of `NSNumber` containing an integer value.

Available in Mac OS X v10.5 and later.

Declared in `NSView.h`.

#### Declared In

`NSView.h`

## Notifications

### NSViewBoundsDidChangeNotification

Posted whenever the `NSView`'s bounds rectangle changes independently of the frame rectangle, if the `NSView` is configured using `setPostsBoundsChangedNotifications:` (page 3170) to post such notifications.

The notification object is the `NSView` object whose bounds rectangle has changed. This notification does not contain a *userInfo* dictionary.

The following methods can result in notification posting:

`setBounds:` (page 3160)

`setBoundsOrigin:` (page 3160)

`setBoundsRotation:` (page 3161)

`setBoundsSize:` (page 3162)

`translateOriginToPoint:` (page 3178)

`scaleUnitSquareToSize:` (page 3155)

`rotateByAngle:` (page 3154)

Note that the bounds rectangle resizes automatically to track the frame rectangle. Because the primary change is that of the frame rectangle, however, `setFrame:` (page 3164) and `setFrameSize:` (page 3167) don't result in a bounds-changed notification.

#### Availability

Available in Mac OS X v10.0 and later.

#### Declared In

`NSView.h`

### NSViewFocusDidChangeNotification

Deprecated notification that was posted for an `NSView` object and each of its descendants (recursively) whenever the frame or bounds geometry of the view changed.

In Mac OS X v10.4 and later, this notification is no longer posted. In earlier version of Mac OS X, use `NSViewBoundsDidChangeNotification` and `NSViewFrameDidChangeNotification` instead to get the same information provided by this notification.

The notification object is the view whose geometry changed. This notification does not contain a *userInfo* dictionary.

**Availability**

Deprecated in Mac OS X v10.4 and later.

**See Also**

[NSViewBoundsDidChangeNotification](#) (page 3193)

[NSViewFrameDidChangeNotification](#) (page 3194)

**Declared In**

NSView.h

**NSViewFrameDidChangeNotification**

Posted whenever the view's frame rectangle changes, if the view is configured using [setPostsFrameChangedNotifications:](#) (page 3171) to post such notifications.

The notification object is the `NSView` object whose frame rectangle has changed. This notification does not contain a *userInfo* dictionary.

The following methods can result in notification posting:

[setFrame:](#) (page 3164)

[setFrameOrigin:](#) (page 3165)

[setFrameRotation:](#) (page 3166)

[setFrameSize:](#) (page 3167)

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSView.h

**NSViewDidUpdateTrackingAreasNotification**

Posted whenever an `NSView` object recalculates its tracking areas. It is sent after the view receives [updateTrackingAreas](#) (page 3181).

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSView.h

**NSViewGlobalFrameDidChangeNotification**

Posted whenever an `NSView` object that has attached surfaces (that is, `NSOpenGLContext` objects) moves to a different screen, or other cases where the `NSOpenGLContext` object needs to be updated. The notification object is the surface's view. This notification does not contain a *userInfo* dictionary.

**Availability**

Available in Mac OS X v10.1 and later.

**Declared In**

NSView.h

## Overview

The `NSViewAnimation` class, a public subclass of `NSAnimation`, offers a convenient way to animate multiple views and windows. The animation effects you can achieve are limited to changes in frame location and size, and to fade-in and fade-out effects.

An `NSViewAnimation` object takes an array of dictionaries from which it determines the objects to animate and the effects to apply to them. Each dictionary must have a target object and, optionally, properties that specify beginning and ending frame and whether to fade in or fade out. (See “[View Animation Dictionary Keys](#)” (page 3197) for further information.) Animations with `NSViewAnimation` are, by default, in non-blocking mode over a duration of 0.5 seconds using the ease in-out animation curve. But you can configure the animation to have any duration, curve, frame rate, and blocking mode. You may also set progress marks, assign a delegate, and implement delegation methods in order to animate view and windows concurrent with the ones specified as targets in the view-animation dictionary.

Invoking the `NSAnimation` [stopAnimation](#) (page 112) method on a running `NSViewAnimation` object moves the animation to the end frame.

## Tasks

### Initializing an NSViewAnimation Object

- [initWithViewAnimations:](#) (page 3196)  
Returns an `NSViewAnimation` object initialized with the supplied information.

### Getting and Setting View-animation Dictionaries

- [setViewAnimations:](#) (page 3196)  
Sets the dictionaries defining the objects to animate.
- [viewAnimations](#) (page 3197)  
Returns the array of dictionaries defining the objects to animate.

## Instance Methods

### initWithViewAnimations:

Returns an `NSViewAnimation` object initialized with the supplied information.

```
- (id)initWithViewAnimations:(NSArray *)viewAnimations
```

#### Parameters

*viewAnimations*

An array of `NSDictionary` objects. Each dictionary specifies a view or window to animate and the effect to apply. *viewAnimations* can be `nil`, but you must later set the required array of dictionaries with [setViewAnimations:](#) (page 3196) if you want to use the capabilities of the `NSViewAnimation` class. See “[View Animation Dictionary Keys](#)” (page 3197) for a description of valid keys and values for dictionaries in *viewAnimations*.

#### Return Value

The created `NSViewAnimation` object or `nil` if there was a problem initializing the object.

#### Availability

Available in Mac OS X v10.4 and later.

#### Related Sample Code

[iSpend](#)  
[Reducer](#)

#### Declared In

`NSAnimation.h`

### setViewAnimations:

Sets the dictionaries defining the objects to animate.

- (void)setViewAnimations:(NSArray \*)*viewAnimations*

**Parameters**

*viewAnimations*

An array of `NSDictionary` objects. Each dictionary specifies a view or window to animate and the effect to apply. Pass in `nil` to remove the current list of dictionaries. See “[View Animation Dictionary Keys](#)” (page 3197) for a description of valid keys and values for dictionaries in *viewAnimations*.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [viewAnimations](#) (page 3197)

**Declared In**

`NSAnimation.h`

## viewAnimations

Returns the array of dictionaries defining the objects to animate.

- (NSArray \*)*viewAnimations*

**Discussion**

Each dictionary in the returned array specifies a view or window to animate and the effect to apply.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [setViewAnimations:](#) (page 3196)

**Declared In**

`NSAnimation.h`

## Constants

### View Animation Dictionary Keys

The following string constants are keys for the dictionaries in the array passed into [initWithViewAnimations:](#) (page 3196) and [setViewAnimations:](#) (page 3196).

```
NSString *NSViewAnimationTargetKey;
NSString *NSViewAnimationStartFrameKey;
NSString *NSViewAnimationEndFrameKey;
NSString *NSViewAnimationEffectKey;
```

**Constants**

`NSViewAnimationTargetKey`

The target of the animation.

The target can be either an `NSView` object or an `NSWindow` object. This property is required.

Available in Mac OS X v10.4 and later.

Declared in `NSAnimation.h`.

`NSViewAnimationStartFrameKey`

The size and location of the window or view at the start of the animation.

The size and location are specified by an `NSRect` structure encoded in an `NSValue` object. This property is optional. If it is not specified, `NSViewAnimation` uses the frame of the window or view at the start of the animation.

Available in Mac OS X v10.4 and later.

Declared in `NSAnimation.h`.

`NSViewAnimationEndFrameKey`

The size and location of the window or view at the end of the animation.

The size and location are specified by an `NSRect` structure encoded in an `NSValue` object. This property is optional. If it is not specified, `NSViewAnimation` uses the frame of the window or view at the start of the animation. If the target is a view and the end frame is empty, the view is hidden at the end.

Available in Mac OS X v10.4 and later.

Declared in `NSAnimation.h`.

`NSViewAnimationEffectKey`

An effect to apply to the animation.

Takes a string constant specifying fade-in or fade-out effects for the target:

`NSViewAnimationFadeInEffect` and `NSViewAnimationFadeOutEffect`. If the target is a view and the effect is to fade out, the view is hidden at the end. If the effect is to fade in an initially hidden view and the end frame is non-empty, the view is unhidden at the end. If the target is a window, the window is ordered in or out as appropriate to the effect. This property is optional.

Available in Mac OS X v10.4 and later.

Declared in `NSAnimation.h`.

**Declared In**

`NSAnimation.h`

**Values for NSViewAnimationEffectKey**

The following constants specify the animation effect to apply and are used as values for the animation effect property of the animation view. See the description of `NSViewAnimationEffectKey` for usage details.

```
NSString *NSViewAnimationFadeInEffect;
NSString *NSViewAnimationFadeOutEffect;
```

**Constants**

`NSViewAnimationFadeInEffect`

Specifies a fade-in type of effect.

Available in Mac OS X v10.4 and later.

Declared in `NSAnimation.h`.

`NSViewAnimationFadeOutEffect`

Specifies a fade-out type of effect.

Available in Mac OS X v10.4 and later.

Declared in `NSAnimation.h`.

**Availability**

Available in Mac OS X v10.4 and later

**Declared In**

`NSAnimation.h`

## Overview

An `NSViewController` object manages a view, typically loaded from a nib file.

This management includes:

- Memory management of top-level objects similar to that of the `NSWindowController` class, taking the same care to prevent reference cycles when controls are bound to the nib file's owner that `NSWindowController` began taking in Mac OS v 10.4.
- Declaring a generic `representedObject` (page 3206) property, to make it easy to establish bindings in the nib to an object that isn't yet known at nib-loading time or readily available to the code that's doing the nib loading.
- Implementing the key-value binding `NSEditor` informal protocol, so that applications using `NSViewController` can easily make bound controls in the views commit or discard the changes the user is making.

`NSViewController` is meant to be highly reusable. For example, the `NSPageLayout` and `NSPrintPanel` `addAccessoryController:` (page 1850) methods take an `NSViewController` instance as the argument, and set the `representedObject` (page 3206) to the `NSPrintInfo` that is to be shown to the user. This allows a developer to easily create new printing accessory views using bindings and the `NSPrintInfo` class' new key-value coding and key-value observing compliance. When the user dismisses a printing panel, `NSPageLayout` and `NSPrintPanel` each send `NSEditor` messages to each accessory view controller to ensure that the user's changes have been committed or discarded properly. The titles of the accessories are

retrieved from the view controllers and shown to the user in pulldown menus that the user can choose from. If your application needs to dynamically associate relatively complex views with the objects that they present to the user, you might be able to reuse `NSViewController` in similar ways.

## Tasks

### Creating A View Controller

- `initWithNibName:bundle:` (page 3205)  
Returns an `NSViewController` object initialized to the nib file in the specified bundle.
- `loadView` (page 3205)  
Instantiate the receiver's view and set it.

### Represented Object

- `setRepresentedObject:` (page 3207)  
Sets the object whose value is being presented in the receiver's view.
- `representedObject` (page 3206)  
Returns the object whose value is being presented in the receiver's view.

### Nib Properties

- `nibName` (page 3206)  
Return the name of the nib bundle to be loaded to instantiate the receivers view.
- `nibName` (page 3206)  
Return the name of the nib to be loaded to instantiate the receivers view

### View Properties

- `view` (page 3209)  
Returns the receiver's view.
- `setView:` (page 3208)  
Sets the receivers view to the specified object.
- `title` (page 3208)  
Returns the localized title of the receiver's view.
- `setTitle:` (page 3207)  
Sets the localized title of the receiver's view to the specified string.

## NSEditor Conformance

- [commitEditingStyleWithDelegate:didCommitSelector:contextInfo:](#) (page 3203)  
Attempt to commit any currently edited results of the receiver.
- [commitEditingStyle](#) (page 3203)  
Returns whether the receiver was able to commit any pending edits.
- [discardEditingStyle](#) (page 3204)  
Causes the receiver to discard any changes, restoring the previous values.

## Instance Methods

### commitEditingStyle

Returns whether the receiver was able to commit any pending edits.

- (BOOL)commitEditingStyle

#### Return Value

Returns YES if the changes were successfully applied to the model, NO otherwise.

#### Discussion

A commit is denied if the receiver fails to apply the changes to the model object, perhaps due to a validation error.

#### Availability

Available in Mac OS X v10.5 and later.

#### See Also

- [commitEditingStyleWithDelegate:didCommitSelector:contextInfo:](#) (page 3203)
- [discardEditingStyle](#) (page 3204)

#### Declared In

NSViewController.h

### commitEditingStyleWithDelegate:didCommitSelector:contextInfo:

Attempt to commit any currently edited results of the receiver.

- (void)commitEditingStyleWithDelegate:(id)delegate  
didCommitSelector:(SEL)didCommitSelector contextInfo:(void \*)contextInfo

#### Parameters

*delegate*

An object that can serve as the receiver's delegate. It should implement the method specified by *didCommitSelector*.

*didCommitSelector*

A selector that is invoked on delegate.

*contextInfo*

Contextual information that is sent as the `contextInfo` argument to delegate when `didCommitSelector` is invoked.

### Discussion

The receiver must have been registered as the editor of an object using [objectDidBeginEditing:](#) (page 3522), and has not yet been unregistered by a subsequent invocation of [objectDidEndEditing:](#) (page 3522). When the committing has either succeeded or failed, send the *delegate* the message specified by `didCommitSelector`.

The `didCommitSelector` method must have the following method signature:.

```
- (void)editor:(id)editor didCommit:(BOOL)didCommit contextInfo:(void *)contextInfo
```

If an error occurs while attempting to commit, for example if key-value coding validation fails, an implementation of this method should typically send the receiver's view [apresentError:modalForWindow:delegate:didPresentSelector:contextInfo:](#) (page 2151) message, specifying the view's containing window.

You may find this method useful in some situations when you want to ensure that pending changes are applied before a change in user interface state. For example, you may need to ensure that changes pending in a text field are applied before a window is closed. See also [commitEditing](#) (page 3203) which performs a similar function but which allows you to handle any errors directly, although it provides no information beyond simple success/failure.

### Availability

Available in Mac OS X v10.5 and later.

### See Also

- [commitEditing](#) (page 3203)
- [discardEditing](#) (page 3204)

### Declared In

NSViewController.h

## discardEditing

Causes the receiver to discard any changes, restoring the previous values.

```
- (void)discardEditing
```

### Availability

Available in Mac OS X v10.5 and later.

### See Also

- [commitEditing](#) (page 3203)

### Declared In

NSViewController.h

## initWithNibName:bundle:

Returns an `NSViewController` object initialized to the nib file in the specified bundle.

```
- (id)initWithNibName:(NSString *)nibNameOrNil bundle:(NSBundle *)nibBundleOrNil
```

### Parameters

*nibNameOrNil*

The name of the nib file, without any leading path information.

*nibBundleOrNil*

The bundle in which to search for the nib file. If you specify `nil`, this method looks for the nib file in the main bundle.

### Return Value

The initialized `NSViewController` object or `nil` if there were errors during initialization or the nib file could not be located.

### Discussion

The `NSViewController` object looks for the nib file in the bundle's language-specific project directories first, followed by the Resources directory.

The specified nib should typically have the class of the file's owner set to `NSViewController`, or a custom subclass, with the `view` outlet connected to a view.

If you pass in a `nil` for *nibNameOrNil* then [nibName](#) (page 3206) will return `nil` and [loadView](#) (page 3205) will throw an exception; in this case you must invoke [setView:](#) (page 3208) before [view](#) (page 3209) is invoked, or override [loadView](#) (page 3205).

### Availability

Available in Mac OS X v10.5 and later.

### Related Sample Code

[ViewController](#)

### Declared In

`NSViewController.h`

## loadView

Instantiate the receiver's view and set it.

```
- (void)loadView
```

### Discussion

The default implementation of this method invokes [nibName](#) (page 3206) and [nibBundle](#) (page 3206) and then uses the `NSNib` class to load the nib with the receiver as the file's owner. If the `view` outlet of the file's owner in the nib is properly connected, the regular nib loading machinery will send the receiver a [setView:](#) (page 3208) message.

### Availability

Available in Mac OS X v10.5 and later.

### Declared In

`NSViewController.h`

## nibBundle

Return the name of the nib bundle to be loaded to instantiate the receivers view.

```
- (NSBundle *)nibBundle
```

### Return Value

The name of the nib bundle.

### Discussion

The default implementation returns whatever value was passed to the initializer.

### Availability

Available in Mac OS X v10.5 and later.

### See Also

- [initWithNibName:bundle:](#) (page 3205)
- [nibName](#) (page 3206)

### Declared In

NSViewController.h

## nibName

Return the name of the nib to be loaded to instantiate the receivers view

```
- (NSString *)nibName
```

### Return Value

The name of the nib.

### Discussion

The default implementation returns whatever value was passed to the initializer.

### Availability

Available in Mac OS X v10.5 and later.

### See Also

- [initWithNibName:bundle:](#) (page 3205)
- [nibBundle](#) (page 3206)

### Declared In

NSViewController.h

## representedObject

Returns the object whose value is being presented in the receiver's view.

```
- (id)representedObject
```

### Return Value

The object whose value is presented in the receiver's view.

**Discussion**

This class is key-value coding and key-value observing compliant for [representedObject](#) (page 3206) so when you use it as the file's owner of a view's nib you can bind controls to the file's owner using key paths that start with `representedObject`.

**Availability**

Available in Mac OS X v10.5 and later.

**See Also**

– [setRepresentedObject:](#) (page 3207)

**Declared In**

`NSViewController.h`

**setRepresentedObject:**

Sets the object whose value is being presented in the receiver's view.

```
- (void)setRepresentedObject:(id)representedObject
```

**Parameters**

*representedObject*

The object whose value is presented in the receiver's view.

**Discussion**

The default implementation of this method doesn't copy the passed-in object, it retains it. In another words, *representedObject* is a to-one relationship, not an attribute.

This class is key-value coding and key-value observing compliant for [representedObject](#) (page 3206) so when you use it as the file's owner of a view's nib you can bind controls to the file's owner using key paths that start with `representedObject`.

**Availability**

Available in Mac OS X v10.5 and later.

**See Also**

– [representedObject](#) (page 3206)

**Declared In**

`NSViewController.h`

**setTitle:**

Sets the localized title of the receiver's view to the specified string.

```
- (void)setTitle:(NSString *)title
```

**Parameters**

*title*

The localized title of the receiver view.

**Discussion**

`NSViewController` does not use the title property directly. This property is here because so many anticipated uses of this class will involve letting the user choose among multiple named views using a pulldown menu or some other user interface.

This class is key value coding and key value compliant for this property.

**Availability**

Available in Mac OS X v10.5 and later.

**See Also**

– [title](#) (page 3208)

**Declared In**

`NSViewController.h`

**setView:**

Sets the receiver's view to the specified object.

```
- (void)setView:(NSView *)view
```

**Parameters**

*view*

The view the receiver should manage.

**Discussion**

You can invoke this method immediately after creating the object to specify a view that's created in a different manner than the receiver's default implementation would provide.

**Availability**

Available in Mac OS X v10.5 and later.

**See Also**

– [view](#) (page 3209)

**Declared In**

`NSViewController.h`

**title**

Returns the localized title of the receiver's view.

```
- (NSString *)title
```

**Return Value**

The localized title of the receiver's view

**Discussion**

`NSViewController` does not use the title property directly. This property is here because so many anticipated uses of this class will involve letting the user choose among multiple named views using a pulldown menu or some other user interface.

This class is key value coding and key value compliant for this property.

**Availability**

Available in Mac OS X v10.5 and later.

**See Also**

- [setTitle:](#) (page 3207)

**Declared In**

NSViewController.h

**view**

Returns the receiver's view.

- (NSView \*)view

**Return Value**

The receiver's view object.

**Discussion**

The default implementation of this method first invokes [loadView](#) (page 3205) if the view hasn't been set yet.

**Availability**

Available in Mac OS X v10.5 and later.

**See Also**

- [setView:](#) (page 3208)

- [loadView](#) (page 3205)

**Declared In**

NSViewController.h

## Overview

The `NSWindow` class defines objects (known as **windows**) that manage and coordinate the windows an application displays on the screen. A single `NSWindow` object corresponds to at most one onscreen window. The two principal functions of a window are to provide an area in which views can be placed and to accept and distribute, to the appropriate views, events the user instigates through actions with the mouse and keyboard.

**Note:** Although the `NSWindow` class inherits the `NSCoding` protocol from `NSResponder`, the class does not support coding. Legacy support for archivers exists but its use is deprecated and may not work. Any attempt to archive or unarchive an `NSWindow` object using a keyed coding object raises an `NSInvalidArgumentException` exception.

## Tasks

### Creating Windows

- [initWithContentRect:styleMask:backing:defer:](#) (page 3266)  
Initializes the window with the specified values.
- [initWithContentRect:styleMask:backing:defer:screen:](#) (page 3267)  
Initializes an allocated window with the specified values.

### Configuring Windows

- [styleMask](#) (page 3331)  
Returns the window's style mask, indicating what kinds of control items it displays.
- [worksWhenModal](#) (page 3337)  
Indicates whether the window is able to receive keyboard and mouse events even when some other window is being run modally.
- [alphaValue](#) (page 3234)  
Returns the window's alpha value.
- [setAlphaValue:](#) (page 3299)  
Applies a given alpha value to the entire window.
- [backgroundColor](#) (page 3237)  
Returns the color of the window's background.
- [setBackgroundColor:](#) (page 3301)  
Sets the window's background color to the given color.
- [contentView](#) (page 3247)  
Returns the window's content view, the highest accessible `NSView` object in the window's view hierarchy.
- [setContentView:](#) (page 3307)  
Makes a given view the window's content view.
- [canHide](#) (page 3241)  
Indicates whether the window can be hidden when its application becomes hidden (during execution of the `NSApplication` [hide:](#) (page 151) method).
- [setCanHide:](#) (page 3303)  
Specifies whether the window can be hidden when its application becomes hidden (during execution of the `NSApplication` [hide:](#) (page 151) method).
- [hidesOnDeactivate](#) (page 3265)  
Indicates whether the window is removed from the screen when its application becomes inactive.

- [setHidesOnDeactivate:](#) (page 3316)  
Specifies whether the window is removed from the screen when the application is inactive.
- [collectionBehavior](#) (page 3244)  
Identifies the window's behavior in window collections.
- [setCollectionBehavior:](#) (page 3304)  
Specifies the window's behavior in window collections.
- [isOpaque](#) (page 3273)  
Indicates whether the window is opaque.
- [setOpaque:](#) (page 3321)  
Specifies whether the window is opaque.
- [hasShadow](#) (page 3265)  
Indicates whether the window has a shadow.
- [setHasShadow:](#) (page 3316)  
Specifies whether the window has a shadow.
- [invalidateShadow](#) (page 3269)  
Invalidates the window shadow so that it is recomputed based on the current window shape.
- [autorecalculatesContentBorderThicknessForEdge:](#) (page 3236)  
Indicates whether the window calculates the thickness of a given border automatically.
- [setAutorecalculatesContentBorderThickness:forEdge:](#) (page 3300)  
Specifies whether the window calculates the thickness of a given border automatically.
- [contentBorderThicknessForEdge:](#) (page 3245)  
Indicates the thickness of a given border of the window.
- [setContentBorderThickness:forEdge:](#) (page 3304)  
Specifies the thickness of a given border of the window.
- [delegate](#) (page 3251)  
Returns the window's delegate.
- [setDelegate:](#) (page 3308)  
Sets the window's delegate to a given object or removes an existing delegate.
- [canBeVisibleOnAllSpaces](#) (page 3240) **Deprecated in Mac OS X v10.5**  
Indicates whether the window can be visible on all spaces or on only one space at a time.
- [setCanBeVisibleOnAllSpaces:](#) (page 3303) **Deprecated in Mac OS X v10.5**  
Specifies whether the window can be visible on all spaces or on only one space at a time.

## Accessing Window Information

- + [defaultDepthLimit](#) (page 3229)  
Returns the default depth limit for instances of `NSWindow`.
- [windowNumber](#) (page 3336)  
Provides the window number of the window's window device.
- [gState](#) (page 3264)  
Returns the window's graphics state object.
- [canStoreColor](#) (page 3241)  
Indicates whether the window has a depth limit that allows it to store color values.

- [deviceDescription](#) (page 3252)  
Returns a dictionary containing information about the window's resolution.
- [canBecomeVisibleWithoutLogin](#) (page 3240)  
Indicates whether the window can be displayed at the log-in window. Default: NO.
- [setCanBecomeVisibleWithoutLogin:](#) (page 3302)  
Specifies whether the window can be displayed at the login window.
- [sharingType](#) (page 3329)  
Indicates the level of access other processes have to the window's content.
- [setSharingType:](#) (page 3325)  
Specifies the level of access other processes have to the window's content.
- [backingType](#) (page 3237)  
Returns the window's backing store type.
- [setBackingType:](#) (page 3302)  
Sets the window's backing store type to a given type.
- [backingLocation](#) (page 3237)  
Indicates the window's backing store location.
- [preferredBackingLocation](#) (page 3288)  
Indicates the preferred location for the window's backing store.
- [setPreferredBackingLocation:](#) (page 3322)  
Specifies the preferred location for the window's backing store.
- [isOneShot](#) (page 3273)  
Indicates whether the window device the window manages is freed when it's removed from the screen list.
- [setOneShot:](#) (page 3321)  
Sets whether the window device that the window manages should be freed when it's removed from the screen list.
- [depthLimit](#) (page 3252)  
Returns the depth limit of the window.
- [setDepthLimit:](#) (page 3309)  
Sets the depth limit of the window to a given limit.
- [hasDynamicDepthLimit](#) (page 3265)  
Indicates whether the window's depth limit can change to match the depth of the screen it's on.
- [setDynamicDepthLimit:](#) (page 3310)  
Sets whether the window changes its depth to match the depth of the screen it's on, or the depth of the deepest screen when it spans multiple screens.

## Getting Layout Information

- + [contentRectForFrameRect:styleMask:](#) (page 3229)  
Returns the content rectangle used by a window with a given frame rectangle and window style.
- + [frameRectForContentRect:styleMask:](#) (page 3230)  
Returns the frame rectangle used by a window with a given content rectangle and window style.

- + `minFrameWidthWithTitle:styleMask:` (page 3231)  
Returns the minimum width a window's frame rectangle must have for it to display a title, with a given window style.
- `contentRectForFrameRect:` (page 3246)  
Returns the window's content rectangle with a given frame rectangle.
- `frameRectForContentRect:` (page 3263)  
Returns the window's frame rectangle with a given content rectangle.

## Managing Windows

- `drawers` (page 3258)  
Returns the collection of drawers associated with the window.
- `windowController` (page 3335)  
Returns the window's window controller.
- `setWindowController:` (page 3328)  
Sets the window's window controller.

## Managing Sheets

- `attachedSheet` (page 3235)  
Returns the sheet attached to the window.
- `isSheet` (page 3274)  
Indicates whether the window has ever run as a modal sheet.
- `window:willPositionSheet:usingRect:` (page 3340) *delegate method*  
Sent to the delegate just before the animation of a sheet, giving it the opportunity to return a custom location for the attachment of a sheet to a window.
- `windowWillBeginSheet:` (page 3346) *delegate method*  
Sent by the default notification center immediately before an `NSWindow` object opens a sheet.
- `windowDidEndSheet:` (page 3342) *delegate method*  
Sent by the default notification center immediately after an `NSWindow` object closes a sheet.

## Sizing

- `frame` (page 3262)  
Returns the window's frame rectangle.
- `setFrameOrigin:` (page 3313)  
Positions the bottom-left corner of the window's frame rectangle at a given point in screen coordinates.
- `setFrameTopLeftPoint:` (page 3314)  
Positions the top-left corner of the window's frame rectangle at a given point in screen coordinates.
- `constrainFrameRect:toScreen:` (page 3244)  
Modifies and returns a frame rectangle so that its top edge lies on a specific screen.
- `cascadeTopLeftFromPoint:` (page 3242)  
Positions the window's top left to a given point.

- [setFrame:display:](#) (page 3311)  
Sets the origin and size of the window's frame rectangle according to a given frame rectangle, thereby setting its position and size onscreen.
- [setFrame:display:animate:](#) (page 3312)  
Sets the origin and size of the window's frame rectangle, with optional animation, according to a given frame rectangle, thereby setting its position and size onscreen.
- [animationResizeTime:](#) (page 3234)  
Specifies the duration of a smooth frame-size change.
- [windowWillUseStandardFrame:defaultFrame:](#) (page 3349) *delegate method*  
Invoked by the [zoom:](#) (page 3337) method while determining a frame an `NSWindow` object may be zoomed to.
- [aspectRatio](#) (page 3235)  
Returns the window's aspect ratio, which constrains the size of its frame rectangle to integral multiples of this ratio when the user resizes it.
- [setAspectRatio:](#) (page 3299)  
Sets the window's aspect ratio, which constrains the size of its frame rectangle to integral multiples of this ratio when the user resizes it.
- [minSize](#) (page 3280)  
Returns the minimum size to which the window's frame (including its title bar) can be sized.
- [setMinSize:](#) (page 3320)  
Sets the minimum size to which the window's frame (including its title bar) can be sized to *aSize*.
- [maxSize](#) (page 3279)  
Returns the maximum size to which the window's frame (including its title bar) can be sized.
- [setMaxSize:](#) (page 3318)  
Sets the maximum size to which the window's frame (including its title bar) can be sized.
- [isZoomed](#) (page 3275)  
Returns a Boolean value that indicates whether the window is in a zoomed state.
- [performZoom:](#) (page 3287)  
This action method simulates the user clicking the zoom box by momentarily highlighting the button and then zooming the window.
- [zoom:](#) (page 3337)  
This action method toggles the size and location of the window between its standard state (provided by the application as the "best" size to display the window's data) and its user state (a new size and location the user may have set by moving or resizing the window).
- [windowShouldZoom:toFrame:](#) (page 3346) *delegate method*  
Sent just before *sender* is zoomed to allow or disallow the operation.
- [resizeFlags](#) (page 3293)  
Returns the flags field of the event record for the mouse-down event that initiated the resizing session.
- [showsResizeIndicator](#) (page 3329)  
Returns a Boolean value that indicates whether the window's resize indicator is visible.
- [setShowsResizeIndicator:](#) (page 3325)  
Specifies whether the window's resize indicator is visible
- [resizeIncrements](#) (page 3293)  
Returns the window's resizing increments.

- `setResizeIncrements:` (page 3325)  
Restricts the user's ability to resize the window so the width and height change by multiples of width and height increments.
- `preservesContentDuringLiveResize` (page 3288)  
Returns a Boolean value that indicates whether the window tries to optimize live resize operations by preserving the content of views that have not changed.
- `setPreservesContentDuringLiveResize:` (page 3323)  
Specifies whether the window tries to optimize live resize operations by preserving the content of views that have not changed.
- `windowWillResize:toSize:` (page 3347) *delegate method*  
Invoked when a window is being resized (whether by the user or through one of the `setFrame:...` methods other than `setFrame:display:` (page 3311)).
- `windowDidResize:` (page 3344) *delegate method*  
Sent by the default notification center immediately after a window has been resized.

## Sizing Content

- `contentAspectRatio` (page 3245)  
Returns the window's content aspect ratio.
- `setContentAspectRatio:` (page 3304)  
Sets the aspect ratio (height in relation to width) of the window's content view, constraining the dimensions of its content rectangle to integral multiples of that ratio when the user resizes it.
- `contentMinSize` (page 3246)  
Returns the minimum size of the window's content view.
- `setContentMinSize:` (page 3305)  
Sets the minimum size of the window's content view in the window's base coordinate system.
- `setContentSize:` (page 3306)  
Sets the size of the window's content view to a given size, which is expressed in the window's base coordinate system.
- `contentMaxSize` (page 3246)  
Returns the maximum size of the window's content view.
- `setContentMaxSize:` (page 3305)  
Sets the maximum size of the window's content view in the window's base coordinate system.
- `contentResizeIncrements` (page 3247)  
Returns the window's content-view resizing increments.
- `setContentResizeIncrements:` (page 3306)  
Restricts the user's ability to resize the window so the width and height of its content view change by multiples of width and height increments.

## Managing Window Layers

- `isVisible` (page 3274)  
Indicates whether the window is visible onscreen (even when it's obscured by other windows).

- [orderOut:](#) (page 3284)  
Removes the window from the screen list, which hides the window.
- [orderBack:](#) (page 3283)  
Moves the window to the back of its level in the screen list, without changing either the key window or the main window.
- [orderFront:](#) (page 3283)  
Moves the window to the front of its level in the screen list, without changing either the key window or the main window.
- [orderFrontRegardless:](#) (page 3284)  
Moves the window to the front of its level, even if its application isn't active, without changing either the key window or the main window.
- [orderWindow:relativeTo:](#) (page 3285)  
Repositions the window's window device in the window server's screen list.
- [level:](#) (page 3276)  
Returns the window level of the window.
- [setLevel:](#) (page 3317)  
Sets the window's window level to a given level.

## Managing Window Frames in User Defaults

- + [removeFrameUsingName:](#) (page 3231)  
Removes the frame data stored under a given name from the application's user defaults.
- [setFrameUsingName:](#) (page 3315)  
Sets the window's frame rectangle by reading the rectangle data stored under a given name from the defaults system.
- [setFrameUsingName:force:](#) (page 3315)  
Sets the window's frame rectangle by reading the rectangle data stored under a given name from the defaults system. Can operate on nonresizable windows.
- [saveFrameUsingName:](#) (page 3294)  
Saves the window's frame rectangle in the user defaults system under a given name.
- [frameAutosaveName:](#) (page 3263)  
Returns the name used to automatically save the window's frame rectangle data in the defaults system, as set through [setFrameAutosaveName:](#) (page 3312).
- [setFrameAutosaveName:](#) (page 3312)  
Sets the name used to automatically save the window's frame rectangle in the defaults system to a given name.
- [stringWithSavedFrame:](#) (page 3330)  
Returns a string representation of the window's frame rectangle.
- [setFrameFromString:](#) (page 3313)  
Sets the window's frame rectangle from a given string representation.

## Managing Key Status

- [isKeyWindow:](#) (page 3271)  
Indicates whether the window is the key window for the application.

- [canBecomeKeyWindow](#) (page 3239)  
Indicates whether the window can become the key window.
- [makeKeyWindow](#) (page 3278)  
Makes the window the key window.
- [makeKeyAndOrderFront:](#) (page 3278)  
Moves the window to the front of the screen list, within its level, and makes it the key window; that is, it shows the window.
- [becomeKeyWindow](#) (page 3238)  
Invoked automatically to inform the window that it has become the key window; never invoke this method directly.
- [windowDidBecomeKey:](#) (page 3340) *delegate method*  
Sent by the default notification center immediately after an `NSWindow` object has become key.
- [resignKeyWindow](#) (page 3292)  
Invoked automatically when the window resigns key window status; never invoke this method directly.
- [windowDidResignKey:](#) (page 3344) *delegate method*  
Sent by the default notification center immediately after an `NSWindow` object has resigned its status as key window.

## Managing Main Status

- [isMainWindow](#) (page 3272)  
Indicates whether the window is the application's main window.
- [canBecomeMainWindow](#) (page 3240)  
Indicates whether the window can become the application's main window.
- [makeMainWindow](#) (page 3279)  
Makes the window the main window.
- [becomeMainWindow](#) (page 3238)  
Invoked automatically to inform the window that it has become the main window; never invoke this method directly.
- [windowDidBecomeMain:](#) (page 3341) *delegate method*  
Sent by the default notification center immediately after an `NSWindow` object has become main.
- [resignMainWindow](#) (page 3292)  
Invoked automatically when the window resigns main window status; never invoke this method directly.
- [windowDidResignMain:](#) (page 3344) *delegate method*  
Sent by the default notification center immediately after an `NSWindow` object has resigned its status as main window.

## Managing Toolbars

- [toolbar](#) (page 3332)  
Returns the window's toolbar.
- [setToolbar:](#) (page 3327)  
Sets the window's toolbar.

- [toggleToolBarShown:](#) (page 3331)  
The action method for the “Hide Toolbar” menu item (which alternates with “Show Toolbar”).
- [runToolBarCustomizationPalette:](#) (page 3294)  
The action method for the “Customize Toolbar...” menu item.

## Managing Attached Windows

- [childWindows](#) (page 3243)  
Returns an array of the window’s attached child windows.
- [addChildWindow:ordered:](#) (page 3233)  
Adds a given window as a child window of the window.
- [removeChildWindow:](#) (page 3290)  
Detaches a given child window from the window.
- [parentWindow](#) (page 3285)  
Returns the parent window to which the window is attached as a child.
- [setParentWindow:](#) (page 3322)  
Adds the window as a child of a given window. For use by subclasses when setting the parent window in the window.

## Managing Window Buffers

- [isFlushWindowDisabled](#) (page 3271)  
Indicates whether the window’s flushing ability is disabled.
- [enableFlushWindow](#) (page 3259)  
Reenables the [flushWindow](#) (page 3262) method for the window after it was disabled through a previous [disableFlushWindow](#) (page 3253) message.
- [disableFlushWindow](#) (page 3253)  
Disables the [flushWindow](#) (page 3262) method for the window.
- [flushWindow](#) (page 3262)  
Flushes the window’s offscreen buffer to the screen if the window is buffered and flushing is enabled.
- [flushWindowIfNeeded](#) (page 3262)  
Flushes the window’s offscreen buffer to the screen if flushing is enabled and if the last [flushWindow](#) (page 3262) message had no effect because flushing was disabled.

## Managing Default Buttons

- [defaultButtonCell](#) (page 3250)  
Returns the button cell that performs as if clicked when the window receives a Return (or Enter) key event.
- [setDefaultButtonCell:](#) (page 3308)  
Makes the key equivalent of button cell the Return (or Enter) key, so when the user presses Return that button performs as if clicked.

- [enableKeyEquivalentForDefaultButtonCell](#) (page 3259)  
Reenables the default button cell's key equivalent, so it performs a click when the user presses Return (or Enter).
- [disableKeyEquivalentForDefaultButtonCell](#) (page 3254)  
Disables the default button cell's key equivalent, so it doesn't perform a click when the user presses Return (or Enter).

## Managing Field Editors

- [fieldEditor:forObject:](#) (page 3260)  
Returns the window's field editor, creating it if requested.
- [windowWillReturnFieldEditor:toObject:](#) (page 3348) *delegate method*  
Invoked when the field editor for a text-displaying object is requested.
- [editingFor:](#) (page 3259)  
Forces the field editor to give up its first responder status and prepares it for its next assignment.

## Managing the Window Menu

- [isExcludedFromWindowsMenu](#) (page 3271)  
Indicates whether the window is excluded from the application's Windows menu.
- [setExcludedFromWindowsMenu:](#) (page 3311)  
Specifies whether the window's title is omitted from the application's Windows menu.

## Managing Cursor Rectangles

- [areCursorRectsEnabled](#) (page 3235)  
Indicates whether the window's cursor rectangles are enabled.
- [enableCursorRects](#) (page 3258)  
Reenables cursor rectangle management within the window after a [disableCursorRects](#) (page 3253) message.
- [disableCursorRects](#) (page 3253)  
Disables all cursor rectangle management within the window.
- [discardCursorRects](#) (page 3255)  
Invalidates all cursor rectangles in the window.
- [invalidateCursorRectsForView:](#) (page 3269)  
Marks as invalid the cursor rectangles of a given `NSView` object in the window's view hierarchy, so they'll be set up again when the window becomes key (or immediately if the window is key).
- [resetCursorRects](#) (page 3292)  
Clears the window's cursor rectangles and the cursor rectangles of the `NSView` objects in its view hierarchy.

## Managing Title Bars

- + [standardWindowButton:forStyleMask:](#) (page 3231)  
Returns a new instance of a given standard window button, sized appropriately for a given window style.
- [standardWindowButton:](#) (page 3330)  
Returns the window button of a given window button kind in the window's view hierarchy.
- [showsToolbarButton](#) (page 3329)  
Indicates whether the toolbar control button is currently displayed.
- [setShowsToolbarButton:](#) (page 3326)  
Specifies whether the window shows the toolbar control button.

## Managing Tooltips

- [allowsToolTipsWhenApplicationIsInactive](#) (page 3233)  
Indicates whether the window can display tooltips even when the application is in the background.
- [setAllowsToolTipsWhenApplicationIsInactive:](#) (page 3298)  
Specifies whether the window can display tooltips even when the application is in the background.

## Handling Events

- + [menuChanged:](#) (page 3230)  
This method does nothing; it is here for backward compatibility.
- [currentEvent](#) (page 3249)  
Returns the event currently being processed by the application, by invoking `NSApplication's currentEvent` (page 147) method.
- [nextEventMatchingMask:](#) (page 3281)  
Returns the next event matching a given mask.
- [nextEventMatchingMask:untilDate:inMode:dequeue:](#) (page 3282)  
Forwards the message to the global `NSApplication` object, `NSApp`.
- [discardEventsMatchingMask:beforeEvent:](#) (page 3255)  
Forwards the message to the `NSApplication` object, `NSApp`.
- [postEvent:atStart:](#) (page 3287)  
Forwards the message to the global `NSApplication` object, `NSApp`.
- [sendEvent:](#) (page 3297)  
This action method dispatches mouse and keyboard events sent to the window by the `NSApplication` object.
- [tryToPerform:with:](#) (page 3332)  
Dispatches action messages with a given argument.

## Managing Responders

- [initialFirstResponder](#) (page 3266)  
Returns view that's made first responder the first time the window is placed onscreen.
- [firstResponder](#) (page 3261)  
Returns the window's first responder.
- [setInitialFirstResponder:](#) (page 3317)  
Sets a given view as the one that's made first responder (also called the key view) the first time the window is placed onscreen.
- [makeFirstResponder:](#) (page 3277)  
Attempts to make a given responder the first responder for the window.

## Managing the Key View Loop

- [selectKeyViewPrecedingView:](#) (page 3296)  
Makes key the view that precedes the given view.
- [selectKeyViewFollowingView:](#) (page 3295)  
Makes key the view that follows the given view.
- [selectPreviousKeyView:](#) (page 3297)  
This action method searches for a candidate previous key view and, if it finds one, invokes [makeFirstResponder:](#) (page 3277) to establish it as the first responder.
- [selectNextKeyView:](#) (page 3296)  
This action method searches for a candidate next key view and, if it finds one, invokes [makeFirstResponder:](#) (page 3277) to establish it as the first responder.
- [keyViewSelectionDirection](#) (page 3276)  
Returns the direction the window is currently using to change the key view.
- [autorecalculatesKeyViewLoop](#) (page 3236)  
Indicates whether the window automatically recalculates the key view loop when views are added.
- [recalculateKeyViewLoop](#) (page 3289)  
Marks the key view loop as dirty and in need of recalculation.
- [setAutorecalculatesKeyViewLoop:](#) (page 3301)  
Specifies whether to recalculate the key view loop automatically when views are added or removed.

## Handling Keyboard Events

- [keyDown:](#) (page 3275)  
Handles a given keyboard event that may need to be interpreted as changing the key view or triggering a keyboard equivalent.

## Handling Mouse Events

- [acceptsMouseMovedEvents](#) (page 3232)  
Indicates whether the window accepts mouse-moved events.

- [ignoresMouseEvents](#) (page 3266)  
Indicates whether the window is transparent to mouse events.
- [setIgnoresMouseEvents:](#) (page 3317)  
Specifies whether the window is transparent to mouse clicks and other mouse events, allowing overlay windows.
- [mouseLocationOutsideOfEventStream](#) (page 3281)  
Returns the current location of the pointer reckoned in the window's base coordinate system.
- [setAcceptsMouseMovedEvents:](#) (page 3298)  
Specifies whether the window is to accept mouse-moved events.

## Bracketing Drawing Operations

- [cacheImageInRect:](#) (page 3238)  
Stores the window's raster image from a given rectangle expressed in the window's base coordinate system.
- [restoreCachedImage](#) (page 3294)  
Splices the window's cached image rectangles, if any, back into its raster image (and buffer if it has one), undoing the effect of any drawing performed within those areas since they were established using [cacheImageInRect:](#) (page 3238).
- [discardCachedImage](#) (page 3254)  
Discards all of the window's cached image rectangles.

## Drawing Windows

- [display](#) (page 3255)  
Passes a display message down the window's view hierarchy, thus redrawing all views within the window, including the frame view that draws the border, title bar, and other peripheral elements.
- [displayIfNeeded](#) (page 3256)  
Passes a `displayIfNeeded` message down the window's view hierarchy, thus redrawing all views that need to be displayed, including the frame view that draws the border, title bar, and other peripheral elements.
- [viewsNeedDisplay](#) (page 3335)  
Indicates whether any of the window's views need to be displayed.
- [setViewsNeedDisplay:](#) (page 3328)  
Specifies whether the window's views need to be displayed..
- [isAutodisplay](#) (page 3270)  
Indicates whether the window automatically displays views that need to be displayed.
- [setAutodisplay:](#) (page 3300)  
Specifies whether the window is to automatically display the views that are marked as needing it.
- [useOptimizedDrawing:](#) (page 3334)  
Specifies whether the window is to optimize focusing and drawing when displaying its views.
- [graphicsContext](#) (page 3264)  
Provides the graphics context associated with the window for the current thread.

## Updating Windows

- [disableScreenUpdatesUntilFlush](#) (page 3254)  
Disables the window's screen updates until the window is flushed.
- [update](#) (page 3333)  
Updates the window.
- [windowDidUpdate:](#) (page 3345) *delegate method*  
Sent by the default notification center immediately after an `NSWindow` object receives an [update](#) (page 3333) message.

## Exposing Windows

- [windowDidExpose:](#) (page 3343) *delegate method*  
Sent by the default notification center immediately after an `NSWindow` object has been exposed.

## Dragging

- [dragImage:at:offset:event:pasteboard:source:slideBack:](#) (page 3257)  
Begins a dragging session.
- [registerForDraggedTypes:](#) (page 3290)  
Registers a give set of pasteboard types as the pasteboard types the window will accept as the destination of an image-dragging session.
- [unregisterDraggedTypes](#) (page 3333)  
Unregisters the window as a possible destination for dragging operations.
- [window:shouldDragDocumentWithEvent:from:withPasteboard:](#) (page 3338) *delegate method*  
Determines whether the sender allows the user to drag the sender's represented file's icon from the sender's title bar.

## Converting Coordinates

- [convertBaseToScreen:](#) (page 3248)  
Converts a given point from the window's base coordinate system to the screen coordinate system.
- [convertScreenToBase:](#) (page 3248)  
Converts a given point from the screen coordinate system to the window's base coordinate system.
- [userSpaceScaleFactor](#) (page 3334)  
Returns the scale factor applied to the window.

## Getting the Undo Manager

- [windowWillReturnUndoManager:](#) (page 3349) *delegate method*  
Invoked when the undo manager for a window is requested. Returns the appropriate undo manager for the window.

## Accessing Edited Status

- `isDocumentEdited` (page 3270)  
Indicates whether the window's document has been edited.
- `setDocumentEdited:` (page 3310)  
Specifies whether the window's document has been edited.

## Managing Titles

- `title` (page 3331)  
Returns either the string that appears in the title bar of the window, or the path to the represented file.
- `setTitle:` (page 3326)  
Sets the string that appears in the window's title bar (if it has one) to a given string and displays the title.
- `setTitleWithRepresentedFilename:` (page 3327)  
Sets a given path as the window's title, formatting it as a file-system path, and records this path as the window's associated filename using `setRepresentedFilename:` (page 3324).
- `representedFilename` (page 3291)  
Returns the pathname of the file the window represents.
- `setRepresentedFilename:` (page 3324)  
Sets the pathname of the file the window represents.
- `representedURL` (page 3291)  
Provides the URL of the file the window represents.
- `setRepresentedURL:` (page 3324)  
Specifies the URL of the file the window represents.
- `window:shouldPopUpDocumentPathMenu:` (page 3339) *delegate method*  
Determines whether the sender displays the title pop-up menu in response to a Command-click on the sender's title.

## Accessing Screen Information

- `screen` (page 3295)  
Returns the screen the window is on.
- `deepestScreen` (page 3250)  
Returns the deepest screen the window is on (it may be split over several screens).
- `displaysWhenScreenProfileChanges` (page 3256)  
Indicates whether the window context should be updated when the screen profile changes or when the window moves to a different screen.
- `setDisplayWhenScreenProfileChanges:` (page 3309)  
Specifies whether the window context should be updated when the screen profile changes.

## Moving

- [isMovableByWindowBackground](#) (page 3272)  
Indicates whether the window is movable by clicking and dragging anywhere in its background.
- [setMovableByWindowBackground:](#) (page 3320)  
Sets whether the window is movable by clicking and dragging anywhere in its background.
- [center](#) (page 3242)  
Sets the window's location to the center of the screen.
- [windowWillMove:](#) (page 3347) *delegate method*  
Sent by the default notification center immediately before an `NSWindow` object is moved.
- [windowDidMove:](#) (page 3343) *delegate method*  
Sent by the default notification center immediately after an `NSWindow` object has been moved.
- [windowDidChangeScreen:](#) (page 3341) *delegate method*  
Sent by the default notification center immediately after an `NSWindow` object has changed screens.
- [windowDidChangeScreenProfile:](#) (page 3341) *delegate method*  
Sent by the default notification center immediately after an `NSWindow` object has changed screen display profiles.

## Closing Windows

- [performClose:](#) (page 3286)  
This action method simulates the user clicking the close button by momentarily highlighting the button and then closing the window.
- [close](#) (page 3243)  
Removes the window from the screen.
- [windowShouldClose:](#) (page 3345) *delegate method*  
Invoked when the user attempts to close a window or a window receives a [performClose:](#) (page 3286) message.
- [windowWillClose:](#) (page 3346) *delegate method*  
Sent by the default notification center immediately before an `NSWindow` object closes.
- [isReleasedWhenClosed](#) (page 3274)  
Indicates whether the window is released when it receives the `close` message.
- [setReleasedWhenClosed:](#) (page 3323)  
Specifies whether the window is released when it receives the `close` message.

## Minimizing Windows

- [isMiniaturized](#) (page 3272)  
Indicates whether the window is minimized.
- [performMiniaturize:](#) (page 3287)  
Simulates the user clicking the minimize button by momentarily highlighting the button, then minimizing the window.
- [miniaturize:](#) (page 3279)  
Removes the window from the screen list and displays the minimized window in the Dock.

- [windowWillMiniaturize:](#) (page 3347) *delegate method*  
Sent by the default notification center immediately before an `NSWindow` object is minimized.
- [windowDidMiniaturize:](#) (page 3343) *delegate method*  
Sent by the default notification center immediately after an `NSWindow` object has been minimized.
- [deminiateurize:](#) (page 3251)  
Deminimizes the window.
- [windowDidDeminiateurize:](#) (page 3342) *delegate method*  
Sent by the default notification center immediately after an `NSWindow` object has been deminimized.
- [miniwindowImage](#) (page 3280)  
Returns the custom miniaturized window image of the window.
- [setMiniwindowImage:](#) (page 3319)  
Sets the window's custom minimized window image to a given image.
- [miniwindowTitle](#) (page 3280)  
Returns the title displayed in the window's minimized window.
- [setMiniwindowTitle:](#) (page 3319)  
Sets the title of the window's miniaturized counterpart to a given string and redisplay it.

## Getting the Dock Tile

- [dockTile](#) (page 3257)  
Provides the application's Dock tile.

## Printing

- [print:](#) (page 3289)  
This action method runs the Print panel, and if the user chooses an option other than canceling, prints the window (its frame view and all subviews).
- [dataWithEPSInsideRect:](#) (page 3249)  
Returns EPS data that draws the region of the window within a given rectangle.
- [dataWithPDFInsideRect:](#) (page 3249)  
Returns PDF data that draws the region of the window within a given rectangle.

## Providing Services

- [validRequestorForSendType:returnType:](#) (page 3334)  
Searches for an object that responds to a Services request.

## Working with Carbon

- [initWithWindowRef:](#) (page 3268)  
Returns a Cocoa window created from a Carbon window.
- [windowRef](#) (page 3336)  
Returns the Carbon `WindowRef` associated with the window, creating one if necessary.

## Class Methods

### **contentRectForFrameRect:styleMask:**

Returns the content rectangle used by a window with a given frame rectangle and window style.

```
+ (NSRect)contentRectForFrameRect:(NSRect>windowFrame
 styleMask:(NSUInteger>windowStyle
```

#### **Parameters**

*windowFrame*

The frame rectangle for the window expressed in screen coordinates.

*windowStyle*

The window style for the window. See “[Constants](#)” (page 3350) for a list of style mask values.

#### **Return Value**

The content rectangle, expressed in screen coordinates, used by the window with *windowFrame* and *windowStyle*.

#### **Discussion**

When a `NSWindow` instance is available, you should use `contentRectForFrameRect:` (page 3246) instead of this method.

#### **Availability**

Available in Mac OS X v10.0 and later.

#### **See Also**

+ `frameRectForContentRect:styleMask:` (page 3230)

#### **Declared In**

`NSWindow.h`

### **defaultDepthLimit**

Returns the default depth limit for instances of `NSWindow`.

```
+ (NSWindowDepth)defaultDepthLimit
```

#### **Return Value**

The default depth limit for instances of `NSWindow`, determined by the depth of the deepest screen level available to the window server.

#### **Discussion**

The value returned can be examined with the Application Kit functions `NSPlanarFromDepth` (page 3686), `NSColorSpaceFromDepth` (page 3662), `NSBitsPerSampleFromDepth` (page 3662), and `NSBitsPerPixelFromDepth` (page 3661).

#### **Availability**

Available in Mac OS X v10.0 and later.

#### **See Also**

- `setDepthLimit:` (page 3309)

- [setDynamicDepthLimit:](#) (page 3310)
- [canStoreColor](#) (page 3241)

**Declared In**

NSWindow.h

**frameRectForContentRect:styleMask:**

Returns the frame rectangle used by a window with a given content rectangle and window style.

```
+ (NSRect)frameRectForContentRect:(NSRect)windowContentRect
 styleMask:(NSUInteger)windowStyle
```

**Parameters***windowContentRect*

The content rectangle for a window expressed in screen coordinates.

*windowStyle*

The window style for the window. See “[Constants](#)” (page 3350) for a list of style mask values.

**Return Value**

The frame rectangle, expressed in screen coordinates, used by the window with *windowContentRect* and *windowStyle*.

**Discussion**

When a `NSWindow` instance is available, you should use [frameRectForContentRect:](#) (page 3263) instead of this method.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

+ [contentRectForFrameRect:styleMask:](#) (page 3229)

**Related Sample Code**

CocoaDragAndDrop

**Declared In**

NSWindow.h

**menuChanged:**

This method does nothing; it is here for backward compatibility.

```
+ (void)menuChanged:(NSMenu *)menu
```

**Parameters***menu*

The menu object that changed.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [menu](#) (page 2133) (NSResponder)

**Declared In**

NSWindow.h

**minFrameWidthWithTitle:styleMask:**

Returns the minimum width a window's frame rectangle must have for it to display a title, with a given window style.

```
+ (CGFloat)minFrameWidthWithTitle:(NSString *)windowTitle
 styleMask:(NSUInteger)windowStyle
```

**Parameters**

*windowTitle*

The title for the window.

*windowStyle*

The window style for the window. See “[Constants](#)” (page 3350) for a list of style mask values.

**Return Value**

The minimum width of the window's frame, using *windowStyle*, in order to display *windowTitle*.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindow.h

**removeFrameUsingName:**

Removes the frame data stored under a given name from the application's user defaults.

```
+ (void)removeFrameUsingName:(NSString *)frameName
```

**Parameters**

*frameName*

The name of the frame to remove.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [setFrameUsingName:](#) (page 3315)

– [setFrameAutosaveName:](#) (page 3312)

**Declared In**

NSWindow.h

**standardWindowButton:forStyleMask:**

Returns a new instance of a given standard window button, sized appropriately for a given window style.

```
+ (NSButton *)standardWindowButton:(NSWindowButton)windowButtonKind
 forStyleMask:(NSUInteger)windowStyle
```

**Parameters**

*windowButtonKind*

The kind of standard window button to return.

*windowStyle*

The window style for which *windowButtonKind* is to be sized. See [“Window Style Masks”](#) (page 3350) for the list of allowable values.

**Return Value**

The new window button of the kind identified by *windowButtonKind*; *nil* when no such button kind exists.

**Discussion**

The caller is responsible for adding the button to the view hierarchy and for setting the target to be the window.

**Availability**

Available in Mac OS X v10.2 and later.

**See Also**

– [standardWindowButton:](#) (page 3330)

**Declared In**

NSWindow.h

## Instance Methods

### acceptsMouseMovedEvents

Indicates whether the window accepts mouse-moved events.

```
- (BOOL)acceptsMouseMovedEvents
```

**Return Value**

YES when the window accepts (and distributes) mouse-moved events; NO otherwise.

**Discussion**

The NSWindow default is NO.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [setAcceptsMouseMovedEvents:](#) (page 3298)

**Declared In**

NSWindow.h

## addChildWindow:ordered:

Adds a given window as a child window of the window.

```
(void)addChildWindow:(NSWindow *)childWindow
ordered:(NSWindowOrderingMode)orderingMode
```

### Parameters

*childWindow*

The child window to order.

*orderingMode*

NSWindowAbove: *childWindow* is ordered immediately in front of the window.

NSWindowBelow: *childWindow* is ordered immediately behind the window.

### Discussion

After the *childWindow* is added as a child of the window, it is maintained in relative position indicated by *orderingMode* for subsequent ordering operations involving either window. While this attachment is active, moving *childWindow* will not cause the window to move (as in sliding a drawer in or out), but moving the window will cause *childWindow* to move.

Note that you should not create cycles between parent and child windows. For example, you should not add window B as child of window A, then add window A as a child of window B.

### Availability

Available in Mac OS X v10.2 and later.

### See Also

- [removeChildWindow:](#) (page 3290)
- [childWindows](#) (page 3243)
- [parentWindow](#) (page 3285)
- [setParentWindow:](#) (page 3322)

### Related Sample Code

GLChildWindowDemo

TrackBall

### Declared In

NSWindow.h

## allowsToolTipsWhenApplicationIsInactive

Indicates whether the window can display tooltips even when the application is in the background.

```
(BOOL)allowsToolTipsWhenApplicationIsInactive
```

### Return Value

YES if the window can display tooltips even when the application is in the background; NO otherwise.

### Discussion

The default is NO.

### Availability

Available in Mac OS X v10.3 and later.

**See Also**

- [setAllowsToolTipsWhenApplicationIsInactive:](#) (page 3298)

**Declared In**

NSWindow.h

## alphaValue

Returns the window's alpha value.

- (CGFloat)alphaValue

**Return Value**

The window's alpha value.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setAlphaValue:](#) (page 3299)

**Related Sample Code**

FunkyOverlayWindow

**Declared In**

NSWindow.h

## animationResizeTime:

Specifies the duration of a smooth frame-size change.

- (NSTimeInterval)animationResizeTime:(NSRect)newWindowFrame

**Parameters**

*newWindowFrame*

The frame rectangle specified in [setFrame:display:animate:](#) (page 3312).

**Return Value**

The duration of the frame size change.

**Discussion**

Subclasses can override this method to control the total time for the frame change.

The `NSWindow` implementation uses the value from the `NSWindowResizeTime` user default as the time in seconds to resize by 150 pixels. If this value is unspecified, `NSWindowResizeTime` is 0.20 seconds (this default value may be differ in different releases of Mac OS X).

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindow.h

## areCursorRectsEnabled

Indicates whether the window's cursor rectangles are enabled.

- (BOOL)areCursorRectsEnabled

### Return Value

YES when cursor rectangles are enabled, NO otherwise.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [enableCursorRects](#) (page 3258)
- [addCursorRect:cursor:](#) (page 3092) (NSView)

### Declared In

NSWindow.h

## aspectRatio

Returns the window's aspect ratio, which constrains the size of its frame rectangle to integral multiples of this ratio when the user resizes it.

- (NSSize)aspectRatio

### Return Value

The window's aspect ratio.

### Discussion

The size of the window's frame rectangle is constrained to integral multiples of this ratio when the user resizes it. You can set an `NSWindow` object's size to any ratio programmatically.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [resizeIncrements](#) (page 3293)
- [setAspectRatio:](#) (page 3299)
- [setFrame:display:](#) (page 3311)

### Declared In

NSWindow.h

## attachedSheet

Returns the sheet attached to the window.

- (NSWindow \*)attachedSheet

### Return Value

The sheet attached to the window; nil when the window doesn't have a sheet attached.

**Availability**

Available in Mac OS X v10.1 and later.

**Declared In**

NSWindow.h

**autorecalculatesContentBorderThicknessForEdge:**

Indicates whether the window calculates the thickness of a given border automatically.

- (BOOL)autorecalculatesContentBorderThicknessForEdge:(NSRectEdge)edge

**Parameters**

*edge*

Border whose thickness autorecalculation status to set:

- NSMaxYEdge: Top border.
- NSMinYEdge: Bottom border.

**Return Value**

YES when the window autorecalculates the given border's thickness; NO otherwise.

**Availability**

Available in Mac OS X v10.5 and later.

**See Also**

- [setAutorecalculatesContentBorderThickness:forEdge:](#) (page 3300)

**Declared In**

NSWindow.h

**autorecalculatesKeyViewLoop**

Indicates whether the window automatically recalculates the key view loop when views are added.

- (BOOL)autorecalculatesKeyViewLoop

**Return Value**

YES if the window automatically recalculates the key view loop when views are added; NO otherwise.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [recalculateKeyViewLoop](#) (page 3289)
- [setAutorecalculatesKeyViewLoop:](#) (page 3301)

**Declared In**

NSWindow.h

## backgroundColor

Returns the color of the window's background.

- (NSColor \*)backgroundColor

### Return Value

The window's background color.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [setBackground-color:](#) (page 3301)

### Declared In

NSWindow.h

## backingLocation

Indicates the window's backing store location.

- (NSWindowBackingLocation)backingLocation

### Return Value

The location of the window's backing store. See [“Constants”](#) (page 3350) for possible values.

### Availability

Available in Mac OS X v10.5 and later.

### See Also

- [preferredBackingLocation](#) (page 3288)

### Declared In

NSWindow.h

## backingType

Returns the window's backing store type.

- (NSBackingStoreType)backingType

### Return Value

The backing store type.

### Discussion

The possible return values are described in [“Constants”](#) (page 3350).

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [setBackingType:](#) (page 3302)

**Declared In**

NSWindow.h

## becomeKeyWindow

Invoked automatically to inform the window that it has become the key window; never invoke this method directly.

- (void)becomeKeyWindow

**Discussion**

This method reestablishes the window's first responder, sends the `becomeKeyWindow` message to that object if it responds, and posts an [NSWindowDidBecomeKeyNotification](#) (page 3360) to the default notification center.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [makeKeyWindow](#) (page 3278)
- [makeKeyAndOrderFront:](#) (page 3278)
- [becomeMainWindow](#) (page 3238)

**Declared In**

NSWindow.h

## becomeMainWindow

Invoked automatically to inform the window that it has become the main window; never invoke this method directly.

- (void)becomeMainWindow

**Discussion**

This method posts an [NSWindowDidBecomeMainNotification](#) (page 3361) to the default notification center.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [makeMainWindow](#) (page 3279)
- [becomeKeyWindow](#) (page 3238)

**Declared In**

NSWindow.h

## cacheImageInRect:

Stores the window's raster image from a given rectangle expressed in the window's base coordinate system.

- (void)cacheImageInRect:(NSRect)*rectangle*

**Parameters***rectangle*

The rectangle representing the image to cache.

**Discussion**

This method allows the window to perform temporary drawing, such as a band around the selection as the user drags the mouse, and to quickly restore the previous image by invoking [restoreCachedImage](#) (page 3294) and [flushWindowIfNeeded](#) (page 3262). The next time the window displays, it discards its cached image rectangles. You can also explicitly use [discardCachedImage](#) (page 3254) to free the memory occupied by cached image rectangles. *aRect* is made integral before caching the image to avoid antialiasing artifacts.

Only the last cached rectangle is remembered and can be restored.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [display](#) (page 3255)

**Declared In**

NSWindow.h

## canBecomeKeyWindow

Indicates whether the window can become the key window.

– (BOOL)canBecomeKeyWindow

**Return Value**

YES if the window can become the key window, NO otherwise.

**Discussion**

Attempts to make the window the key window are abandoned if this method returns NO. The [NSWindow](#) (page 3211) implementation returns YES if the window has a title bar or a resize bar, NO otherwise.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [isKeyWindow](#) (page 3271)

– [makeKeyWindow](#) (page 3278)

**Related Sample Code**

CIAnnotation

FancyAbout

FunkyOverlayWindow

RoundTransparentWindow

TrackBall

**Declared In**

NSWindow.h

## canBecomeMainWindow

Indicates whether the window can become the application's main window.

- (BOOL)canBecomeMainWindow

### Return Value

YES when the window can become the main window; NO otherwise.

### Discussion

Attempts to make the window the main window are abandoned if this method returns NO. The `NSWindow` implementation returns YES if the window is visible, is not an `NSPanel` object, and has a title bar or a resize mechanism. Otherwise it returns NO.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [isMainWindow](#) (page 3272)
- [makeMainWindow](#) (page 3279)

### Related Sample Code

FancyAbout

### Declared In

`NSWindow.h`

## canBecomeVisibleWithoutLogin

Indicates whether the window can be displayed at the log-in window. Default: NO.

- (BOOL)canBecomeVisibleWithoutLogin

### Return Value

YES when the window can be displayed at the log-in window; NO otherwise.

### Availability

Available in Mac OS X v10.5 and later.

### See Also

- [setCanBecomeVisibleWithoutLogin:](#) (page 3302)

### Declared In

`NSWindow.h`

## canBeVisibleOnAllSpaces

Indicates whether the window can be visible on all spaces or on only one space at a time. (Deprecated in Mac OS X v10.5.)

- (BOOL)canBeVisibleOnAllSpaces

### Return Value

YES when the window can be visible on all spaces; NO when it can be visible on only one space at a time.

**Discussion**

The default is NO.

**Availability**

Available in Mac OS X v10.5 and later.

Deprecated in Mac OS X v10.5.

**Declared In**

NSWindow.h

## canHide

Indicates whether the window can be hidden when its application becomes hidden (during execution of the `NSApplication` [hide:](#) (page 151) method).

- (BOOL)canHide

**Return Value**

YES if the window can be hidden when its application becomes hidden; NO otherwise.

**Discussion**

The default is YES.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setCanHide:](#) (page 3303)

**Declared In**

NSWindow.h

## canStoreColor

Indicates whether the window has a depth limit that allows it to store color values.

- (BOOL)canStoreColor

**Return Value**

YES when the window's depth limit allows it to store color values; NO otherwise.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [depthLimit](#) (page 3252)

- [shouldDrawColor](#) (page 3175) (NSView)

**Declared In**

NSWindow.h

## **cascadeTopLeftFromPoint:**

Positions the window's top left to a given point.

- (NSPoint)cascadeTopLeftFromPoint:(NSPoint) *topLeft*

### **Parameters**

*topLeft*

The new top-left point, in screen coordinates, for the window. When `NSZeroPoint`, the window is not moved, except as needed to constrain to the visible screen

### **Return Value**

The point shifted from top left of the window in screen coordinates.

### **Discussion**

The returned point can be passed to a subsequent invocation of `cascadeTopLeftFromPoint:` to position the next window so the title bars of both windows are fully visible.

### **Availability**

Available in Mac OS X v10.0 and later.

### **See Also**

-  [setFrameTopLeftPoint:](#) (page 3314)

### **Declared In**

NSWindow.h

## **center**

Sets the window's location to the center of the screen.

- (void)center

### **Discussion**

The window is placed exactly in the center horizontally and somewhat above center vertically. Such a placement carries a certain visual immediacy and importance. This method doesn't put the window onscreen, however; use [makeKeyAndOrderFront:](#) (page 3278) to do that.

You typically use this method to place a window—most likely an alert dialog—where the user can't miss it. This method is invoked automatically when a panel is placed on the screen by the [runModalForWindow:](#) (page 164) method of the `NSApplication` class.

### **Availability**

Available in Mac OS X v10.0 and later.

### **Related Sample Code**

CocoaVideoFrameToGWorld

VertexPerformanceTest

### **Declared In**

NSWindow.h

## childWindows

Returns an array of the window's attached child windows.

- (NSArray \*)childWindows

### Return Value

An array containing the window's child windows.

### Availability

Available in Mac OS X v10.2 and later.

### See Also

- [removeChildWindow:](#) (page 3290)
- [addChildWindow:ordered:](#) (page 3233)
- [parentWindow](#) (page 3285)
- [setParentWindow:](#) (page 3322)

### Declared In

NSWindow.h

## close

Removes the window from the screen.

- (void)close

### Discussion

If the window is set to be released when closed, a `release` message is sent to the object after the current event is completed. For an `NSWindow` object, the default is to be released on closing, while for an `NSPanel` object, the default is not to be released. You can use the [setReleasedWhenClosed:](#) (page 3323) method to change the default behavior.

A window doesn't have to be visible to receive the close message. For example, when the application terminates, it sends the close message to all windows in its window list, even those that are not currently visible.

The close method posts an [NSWindowWillCloseNotification](#) (page 3364) notification to the default notification center.

The close method differs in two important ways from the [performClose:](#) (page 3286) method:

- It does not attempt to send a [windowShouldClose:](#) (page 3345) message to the window or its delegate.
- It does not simulate the user clicking the close button by momentarily highlighting the button.

Use [performClose:](#) (page 3286) if you need these features.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [orderOut:](#) (page 3284)

**Declared In**

NSWindow.h

**collectionBehavior**

Identifies the window's behavior in window collections.

- (NSWindowCollectionBehavior)collectionBehavior;

**Return Value**

The collection behavior identifier.

**Availability**

Available in Mac OS X v10.5 and later.

**See Also**- [setCollectionBehavior:](#) (page 3304)**Declared In**

NSWindow.h

**constrainFrameRect:toScreen:**

Modifies and returns a frame rectangle so that its top edge lies on a specific screen.

- (CGRect)constrainFrameRect:(CGRect) *frameRect* toScreen:(NSScreen \*) *screen***Parameters***frameRect*

The proposed frame rectangle to adjust.

*screen*

The screen on which the top edge of the window's frame is to lie.

**Return Value**

The adjusted frame rectangle.

**Discussion**

If the window is resizable and the window's height is greater than the screen height, the rectangle's height is adjusted to fit within the screen as well. The rectangle's width and horizontal location are unaffected. You shouldn't need to invoke this method yourself; it's invoked automatically (and the modified frame is used to locate and set the size of the window) whenever a titled `NSWindow` object is placed onscreen and whenever its size is changed.

Subclasses can override this method to prevent their instances from being constrained or to constrain them differently.

**Availability**

Available in Mac OS X v10.0 and later.

**Related Sample Code**

iSpend

**Declared In**

NSWindow.h

**contentAspectRatio**

Returns the window's content aspect ratio.

- (NSSize)contentAspectRatio

**Return Value**

The window's content aspect ratio.

**Discussion**

The default content aspect ratio is (0, 0).

**Availability**

Available in Mac OS X v10.3 and later.

**See Also**

- [setContentAspectRatio:](#) (page 3304)

**Declared In**

NSWindow.h

**contentBorderThicknessForEdge:**

Indicates the thickness of a given border of the window.

- (CGFloat)contentBorderThicknessForEdge:(NSRectEdge)*edge*

**Parameters**

*edge*

Border whose thickness to get:

- NSMaxYEdge: Top border.
- NSMinYEdge: Bottom border.

**Return Value**

Thickness of the given border, in points.

**Availability**

Available in Mac OS X v10.5 and later.

**See Also**

- [setContentBorderThickness:forEdge:](#) (page 3304)

**Declared In**

NSWindow.h

**contentMaxSize**

Returns the maximum size of the window's content view.

- (NSSize)contentMaxSize

**Return Value**

The maximum size of the window's content view.

**Availability**

Available in Mac OS X v10.3 and later.

**See Also**

- [setContentMaxSize:](#) (page 3305)
- [contentMinSize](#) (page 3246)

**Declared In**

NSWindow.h

**contentMinSize**

Returns the minimum size of the window's content view.

- (NSSize)contentMinSize

**Return Value**

The minimum size of the window's content view.

**Availability**

Available in Mac OS X v10.3 and later.

**See Also**

- [setContentMinSize:](#) (page 3305)
- [contentMaxSize](#) (page 3246)

**Declared In**

NSWindow.h

**contentRectForFrameRect:**

Returns the window's content rectangle with a given frame rectangle.

- (NSRect)contentRectForFrameRect:(NSRect)*windowFrame*

**Parameters**

*windowFrame*

The frame rectangle for the window expressed in screen coordinates.

**Return Value**

The window's content rectangle, expressed in screen coordinates, with *windowFrame*.

**Discussion**

The window uses its current style mask in computing the content rectangle. See “[Constants](#)” (page 3350) for a list of style mask values. The main advantage of this instance-method counterpart to [contentRectForFrameRect:styleMask:](#) (page 3229) is that it allows you to take toolbars into account when converting between content and frame rectangles. (The toolbar is not included in the content rectangle.)

**Availability**

Available in Mac OS X v10.3 and later.

**See Also**

- [frameRectForContentRect:](#) (page 3263)
- + [contentRectForFrameRect:styleMask:](#) (page 3229)

**Declared In**

NSWindow.h

## contentResizeIncrements

Returns the window's content-view resizing increments.

- (NSSize)contentResizeIncrements

**Return Value**

The window's content-view resizing increments.

**Availability**

Available in Mac OS X v10.3 and later.

**See Also**

- [setContentResizeIncrements:](#) (page 3306)

**Declared In**

NSWindow.h

## contentView

Returns the window's content view, the highest accessible *NSView* object in the window's view hierarchy.

- (id)contentView

**Return Value**

The content view.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setContentView:](#) (page 3307)

**Declared In**

NSWindow.h

**currentEvent**

Returns the event currently being processed by the application, by invoking `NSApplication`'s [currentEvent](#) (page 147) method.

- (NSEvent \*)currentEvent

**Return Value**

The event being processed by the application.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindow.h

**dataWithEPSInsideRect:**

Returns EPS data that draws the region of the window within a given rectangle.

- (NSData \*)dataWithEPSInsideRect:(NSRect)rect

**Parameters**

*rect*

A rectangle (expressed in the window's coordinate system) that identifies the region to be expressed as EPS data.

**Return Value**

The region in the window (identified by *rect*) as EPS data.

**Discussion**

This data can be placed on a pasteboard, written to a file, or used to create an `NSImage` object.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [dataWithEPSInsideRect:](#) (page 3112) (NSView)
- [writeEPSInsideRect:toPasteboard:](#) (page 3189) (NSView)

**Declared In**

NSWindow.h

**dataWithPDFInsideRect:**

Returns PDF data that draws the region of the window within a given rectangle.

- (NSData \*)dataWithPDFInsideRect:(NSRect)rect

**Parameters***rect*

A rectangle (expressed in the window's coordinate system) that identifies the region to be expressed as PDF data.

**Return Value**

The region in the window (identified by *rect*) as PDF data.

**Discussion**

This data can be placed on a pasteboard, written to a file, or used to create an `NSImage` object.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [dataWithPDFInsideRect:](#) (page 3113) (`NSView`)
- [writePDFInsideRect:toPasteboard:](#) (page 3189) (`NSView`)

**Declared In**

`NSWindow.h`

**deepestScreen**

Returns the deepest screen the window is on (it may be split over several screens).

- (`NSScreen *`)`deepestScreen`

**Return Value**

The deepest screen the window is on; `nil` when the window is offscreen.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [screen](#) (page 3295)
- + [deepestScreen](#) (page 2260) (`NSScreen`)

**Declared In**

`NSWindow.h`

**defaultButtonCell**

Returns the button cell that performs as if clicked when the window receives a Return (or Enter) key event.

- (`NSButtonCell *`)`defaultButtonCell`

**Return Value**

The button cell.

**Discussion**

This cell draws itself as the focal element for keyboard interface control, unless another button cell is focused on, in which case the default button cell temporarily draws itself as normal and disables its key equivalent.

The window receives a Return key event if no responder in its responder chain claims it, or if the user presses the Control key along with the Return key.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setDefaultButtonCell:](#) (page 3308)
- [disableKeyEquivalentForDefaultButtonCell](#) (page 3254)
- [enableKeyEquivalentForDefaultButtonCell](#) (page 3259)

**Declared In**

NSWindow.h

## delegate

Returns the window's delegate.

- (id)delegate

**Return Value**

The window's delegate, or `nil` if it doesn't have a delegate.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setDelegate:](#) (page 3308)

**Related Sample Code**

FancyAbout

Quartz Composer WWDC 2005 TextEdit

TextEditPlus

**Declared In**

NSWindow.h

## deminiateurize:

Deminimizes the window.

- (void)deminiateurize:(id)sender

**Parameters**

*sender*

The message's sender.

**Discussion**

Invoke this method to programmatically deminimize a minimized window in the Dock.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [miniaturize:](#) (page 3279)
- [styleMask](#) (page 3331)

**Declared In**

NSWindow.h

## depthLimit

Returns the depth limit of the window.

- (NSUInteger)depthLimit

**Return Value**

Depth limit of the window.

**Discussion**

The value returned can be examined with the Application Kit functions [NSPlanarFromDepth](#) (page 3686), [NSColorSpaceFromDepth](#) (page 3662), [NSBitsPerSampleFromDepth](#) (page 3662), and [NSBitsPerPixelFromDepth](#) (page 3661).

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- + [defaultDepthLimit](#) (page 3229)
- [setDepthLimit:](#) (page 3309)
- [setDynamicDepthLimit:](#) (page 3310)

**Declared In**

NSWindow.h

## deviceDescription

Returns a dictionary containing information about the window's resolution.

- (NSDictionary \*)deviceDescription

**Return Value**

A dictionary containing resolution information about the window, such as color, depth, and so on.

**Discussion**

This information is useful for tuning images and colors to the window's display capabilities. The contents of the dictionary are described in “[Display Device Descriptions](#)” (page 3352).

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [deviceDescription](#) (page 2262) (NSScreen)
- [bestRepresentationForDevice:](#) (page 1314) (NSImage)
- [colorUsingColorSpaceName:](#) (page 697) (NSColor)

**Related Sample Code**

CocoaDVDPlayer

**Declared In**

NSWindow.h

**disableCursorRects**

Disables all cursor rectangle management within the window.

```
- (void)disableCursorRects
```

**Discussion**

Use this method when you need to do some special cursor manipulation and you don't want the Application Kit interfering.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [enableCursorRects](#) (page 3258)

**Declared In**

NSWindow.h

**disableFlushWindow**

Disables the [flushWindow](#) (page 3262) method for the window.

```
- (void)disableFlushWindow
```

**Discussion**

If the window is buffered, disabling [flushWindow](#) (page 3262) prevents drawing from being automatically flushed by the `NSView display...` methods from the window's backing store to the screen. This method permits several views to be drawn before the results are shown to the user.

Flushing should be disabled only temporarily, while the window's display is being updated. Each `disableFlushWindow` message must be paired with a subsequent [enableFlushWindow](#) (page 3259) message. Invocations of these methods can be nested; flushing isn't reenabled until the last (unnested) [enableFlushWindow](#) (page 3259) message is sent.

**Availability**

Available in Mac OS X v10.0 and later.

**Related Sample Code**

CocoaDVDPlayer

**Declared In**

NSWindow.h

## disableKeyEquivalentForDefaultButtonCell

Disables the default button cell's key equivalent, so it doesn't perform a click when the user presses Return (or Enter).

- (void)disableKeyEquivalentForDefaultButtonCell

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [defaultButtonCell](#) (page 3250)
- [enableKeyEquivalentForDefaultButtonCell](#) (page 3259)

### Declared In

NSWindow.h

## disableScreenUpdatesUntilFlush

Disables the window's screen updates until the window is flushed.

- (void)disableScreenUpdatesUntilFlush

### Discussion

This method can be invoked to synchronize hardware surface flushes with the window's flushes. The window immediately disables screen updates using the [NSDisableScreenUpdates](#) (page 3665) function and reenables screen updates when the window flushes. Sending this message multiple times during a window update cycle has no effect.

### Availability

Available in Mac OS X v10.4 and later.

### Related Sample Code

GLSLShowpiece

### Declared In

NSWindow.h

## discardCachedImage

Discards all of the window's cached image rectangles.

- (void)discardCachedImage

### Discussion

An [NSWindow](#) object automatically discards its cached image rectangles when it displays.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [cacheImageInRect:](#) (page 3238)
- [restoreCachedImage](#) (page 3294)

- [display](#) (page 3255)

**Declared In**

NSWindow.h

## discardCursorRects

Invalidates all cursor rectangles in the window.

- (void)discardCursorRects

**Discussion**

This method is invoked by [resetCursorRects](#) (page 3292) to clear out existing cursor rectangles before resetting them. You shouldn't invoke it in the code you write, but you might want to override it to change its behavior.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindow.h

## discardEventsMatchingMask:beforeEvent:

Forwards the message to the `NSApplication` object, `NSApp`.

- (void)discardEventsMatchingMask:(NSUInteger)eventMask beforeEvent:(NSEvent \*)lastEvent

**Parameters**

*eventMask*

The mask of the events to discard.

*lastEvent*

The event up to which queued events are discarded from the queue.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [discardEventsMatchingMask:beforeEvent:](#) (page 148) (`NSApplication`)

**Declared In**

NSWindow.h

## display

Passes a display message down the window's view hierarchy, thus redrawing all views within the window, including the frame view that draws the border, title bar, and other peripheral elements.

- (void)display

**Discussion**

You rarely need to invoke this method. `NSWindow` objects normally record which of their views need display and display them automatically on each pass through the event loop.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [display](#) (page 3114) (`NSView`)
- [displayIfNeeded](#) (page 3256)
- [isAutodisplay](#) (page 3270)

**Related Sample Code**

`GLChildWindowDemo`

**Declared In**

`NSWindow.h`

## **displayIfNeeded**

Passes a `displayIfNeeded` message down the window's view hierarchy, thus redrawing all views that need to be displayed, including the frame view that draws the border, title bar, and other peripheral elements.

- (void)displayIfNeeded

**Discussion**

This method is useful when you want to modify some number of views and then display only the ones that were modified.

You rarely need to invoke this method. `NSWindow` objects normally record which of their views need display and display them automatically on each pass through the event loop.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [display](#) (page 3255)
- [displayIfNeeded](#) (page 3115) (`NSView`)
- [setNeedsDisplay:](#) (page 3169) (`NSView`)
- [isAutodisplay](#) (page 3270)

**Declared In**

`NSWindow.h`

## **displaysWhenScreenProfileChanges**

Indicates whether the window context should be updated when the screen profile changes or when the window moves to a different screen.

- (BOOL)displaysWhenScreenProfileChanges

**Return Value**

YES when the window context should be updated when the screen profile changes or when the window moves to a different screen; NO otherwise.

**Discussion**

The default value is NO.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [setDisplayWhenScreenProfileChanges:](#) (page 3309)

**Related Sample Code**

VideoViewer

**Declared In**

NSWindow.h

**dockTile**

Provides the application's Dock tile.

```
- (NSDockTile *)dockTile
```

**Return Value**

The application's Dock tile.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSWindow.h

**dragImage:at:offset:event:pasteboard:source:slideBack:**

Begins a dragging session.

```
- (void)dragImage:(NSImage *)image at:(NSPoint)imageLocation
 offset:(NSSize)pointerOffset event:(NSEvent *)event pasteboard:(NSPasteboard
*)pasteboard source:(id)sourceObject slideBack:(BOOL)slideBack
```

**Parameters**

*image*

The object to be dragged.

*imageLocation*

Location of the image's bottom-left corner in the window's coordinate system. It determines the placement of the dragged image under the pointer.

*initialOffset*

The pointer's location relative to the mouse-down location. Not used in Mac OS X v10.4 and later.

*event*

The left-mouse down event that triggered the dragging operation.

*pasteboard*

The pasteboard that holds the data to be transferred to the destination.

*sourceObject*

The object serving as the controller of the dragging operation. It must conform to the `NSDraggingSource` informal protocol.

*slideBack*

Specifies whether the drag image should slide back to *imageLocation* if it's rejected by the drag destination. Pass `YES` to specify slideback behavior, `NO` to specify otherwise.

**Discussion**

This method should be invoked only from within a view's implementation of the `mouseDown:` (page 2133) or `mouseDragged:` (page 2134) methods (which overrides the version defined in `NSResponder` class). Essentially the same as the `NSView` method of the same name, except that *imageLocation* is given in the `NSWindow` object's base coordinate system.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- `dragImage:at:offset:event:pasteboard:source:slideBack:` (page 3118) (`NSView`)

**Declared In**

`NSWindow.h`

**drawers**

Returns the collection of drawers associated with the window.

- (NSArray \*)drawers

**Return Value**

The collection of drawers associated with the window.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSDrawer.h`

**enableCursorRects**

Reenables cursor rectangle management within the window after a `disableCursorRects` (page 3253) message.

- (void)enableCursorRects

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSWindow.h`

## enableFlushWindow

Reenables the [flushWindow](#) (page 3262) method for the window after it was disabled through a previous [disableFlushWindow](#) (page 3253) message.

- (void)enableFlushWindow

### Availability

Available in Mac OS X v10.0 and later.

### Related Sample Code

CocoaDVDPlayer

### Declared In

NSWindow.h

## enableKeyEquivalentForDefaultButtonCell

Reenables the default button cell's key equivalent, so it performs a click when the user presses Return (or Enter).

- (void)enableKeyEquivalentForDefaultButtonCell

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [defaultButtonCell](#) (page 3250)
- [disableKeyEquivalentForDefaultButtonCell](#) (page 3254)

### Declared In

NSWindow.h

## endEditingFor:

Forces the field editor to give up its first responder status and prepares it for its next assignment.

- (void)endEditingFor:(id)object

### Parameters

*object*

The object that is using the window's field editor.

### Discussion

If the field editor is the first responder, it's made to resign that status even if its [resignFirstResponder](#) (page 2152) method returns NO. This registration forces the field editor to send a [textDidEndEditing:](#) (page 2701) message to its delegate. The field editor is then removed from the view hierarchy, its delegate is set to nil, and it's emptied of any text it may contain.

This method is typically invoked by the object using the field editor when it's finished. Other objects normally change the first responder by simply using [makeFirstResponder:](#) (page 3277), which allows a field editor or other object to retain its first responder status if, for example, the user has entered an invalid value. The [endEditingFor:](#) (page 3259) method should be used only as a last resort if the field editor refuses to resign

first responder status. Even in this case, you should always allow the field editor a chance to validate its text and take whatever other action it needs first. You can do this by first trying to make the `NSWindow` object the first responder:

```
if ([myWindow makeFirstResponder:myWindow]) {
 /* All fields are now valid; it's safe to use fieldEditor:forObject:
 to claim the field editor. */
}
else {
 /* Force first responder to resign. */
 [myWindow endEditingFor:nil];
}
```

#### Availability

Available in Mac OS X v10.0 and later.

#### See Also

- [fieldEditor:forObject:](#) (page 3260)
- [windowWillReturnFieldEditor:toObject:](#) (page 3348)

#### Declared In

`NSWindow.h`

## fieldEditor:forObject:

Returns the window's field editor, creating it if requested.

```
- (NSText *)fieldEditor:(BOOL)createWhenNeeded forObject:(id)anObject
```

#### Parameters

*createWhenNeeded*

If YES, creates a field editor if one doesn't exist; if NO, does not create a field editor.

A freshly created `NSWindow` object doesn't have a field editor. After a field editor has been created for a window, the *createWhenNeeded* argument is ignored. By passing NO for *createWhenNeeded* and testing the return value, however, you can predicate an action on the existence of the field editor.

*anObject*

A text-displaying object for which the delegate (in [windowWillReturnFieldEditor:toObject:](#) (page 3348)) assigns a custom field editor. Pass `nil` to get the default field editor, which can be the `NSWindow` field editor or a custom field editor returned by the delegate.

#### Return Value

Returns the field editor for the designated object (*anObject*) or, if *anObject* is `nil`, the default field editor. Returns `nil` if *createFlag* is NO and if the field editor doesn't exist.

#### Discussion

The field editor is a single `NSTextView` object that is shared among all the controls in a window for light text-editing needs. It is automatically instantiated when needed, and it can be used however your application sees fit. Typically, the field editor is used by simple text-bearing objects—for example, an `NSTextField` object uses its window's field editor to display and manipulate text. The field editor can be shared by any number of objects, and so its state may be constantly changing. Therefore, it shouldn't be used to display text that demands sophisticated layout (for this you should create a dedicated `NSTextView` object).

The field editor may be in use by some view object, so be sure to properly dissociate it from that object before actually using it yourself (the appropriate way to do this is illustrated in the description of [endEditingFor:](#) (page 3259)). Once you retrieve the field editor, you can insert it in the view hierarchy, set a delegate to interpret text events, and have it perform whatever editing is needed. Then, when it sends a [textDidEndEditing:](#) (page 2701) message to the delegate, you can get its text to display or store and remove the field editor using [endEditingFor:](#) (page 3259).

The window's delegate can substitute a custom field editor in place of the window's field editor by implementing [windowWillReturnFieldEditor:toObject:](#) (page 3348). The custom field editor can become the default editor (common to all text-displaying objects) or specific to a particular text-displaying object (*anObject*). The window sends this message to its delegate with itself and *anObject* as the arguments; if the delegate returns a non-`nil` value, the window returns that object instead of its field editor in [fieldEditor:forObject:](#). However, note the following:

- If the window's delegate is identical to *anObject*, [windowWillReturnFieldEditor:toObject:](#) (page 3348) isn't sent to the delegate.
- The object returned by the delegate method, though it may become first responder, does not become the window's default field editor. Other objects continue to use the window's default field editor.

#### Availability

Available in Mac OS X v10.0 and later.

#### Declared In

NSWindow.h

## firstResponder

Returns the window's first responder.

```
- (NSResponder *)firstResponder
```

#### Return Value

The first responder.

#### Discussion

The first responder is usually the first object in a responder chain to receive an event or action message. In most cases, the first responder is a view object in that the user selects or activates with the mouse or keyboard.

You can use the `firstResponder` method in custom subclasses of responder classes (NSWindow, NSApplication, NSView, and subclasses) to determine if an instance of the subclass is currently the first responder. You can also use it to help locate a text field that currently has first-responder status. For more on this subject, see "Event Handling Basics."

#### Availability

Available in Mac OS X v10.0 and later.

#### See Also

- [makeFirstResponder:](#) (page 3277)
- [acceptsFirstResponder](#) (page 2117) (NSResponder)

#### Declared In

NSWindow.h

## flushWindow

Flushes the window's offscreen buffer to the screen if the window is buffered and flushing is enabled.

- (void)flushWindow

### Discussion

Does nothing for other display devices, such as a printer. This method is automatically invoked by the `NSWindow` [display](#) (page 3255) and [displayIfNeeded](#) (page 3256) methods and the corresponding `NSView` [display](#) (page 3114) and [displayIfNeeded](#) (page 3115) methods.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [flushWindowIfNeeded](#) (page 3262)
- [disableFlushWindow](#) (page 3253)
- [enableFlushWindow](#) (page 3259)

### Related Sample Code

GLChildWindowDemo

### Declared In

`NSWindow.h`

## flushWindowIfNeeded

Flushes the window's offscreen buffer to the screen if flushing is enabled and if the last [flushWindow](#) (page 3262) message had no effect because flushing was disabled.

- (void)flushWindowIfNeeded

### Discussion

To avoid unnecessary flushing, use this method rather than [flushWindow](#) (page 3262) to flush an `NSWindow` object after flushing has been reenabled.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [disableFlushWindow](#) (page 3253)
- [enableFlushWindow](#) (page 3259)

### Declared In

`NSWindow.h`

## frame

Returns the window's frame rectangle.

- (NSRect)frame

**Return Value**

The frame rectangle of the window in screen coordinates.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [screen](#) (page 3295)
- [deepestScreen](#) (page 3250)

**Related Sample Code**

BasicCocoaAnimations

FunkyOverlayWindow

iSpend

Quartz Composer WWDC 2005 TextEdit

TextEditPlus

**Declared In**

NSWindow.h

**frameAutosaveName**

Returns the name used to automatically save the window's frame rectangle data in the defaults system, as set through [setFrameAutosaveName:](#) (page 3312).

- (NSString \*)frameAutosaveName

**Return Value**

The name used to save the window's frame rectangle automatically in the defaults system.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setFrameUsingName:](#) (page 3315)

**Declared In**

NSWindow.h

**frameRectForContentRect:**

Returns the window's frame rectangle with a given content rectangle.

- (NSRect)frameRectForContentRect:(NSRect)*windowContent*

**Parameters**

*windowContent*

The content rectangle for the window expressed in screen coordinates.

**Return Value**

The window's frame rectangle, expressed in screen coordinates, with *windowContent*.

**Discussion**

The window uses its current style mask in computing the frame rectangle. See “[Constants](#)” (page 3350) for a list of style mask values. The major advantage of this instance-method counterpart to [frameRectForContentRect:styleMask:](#) (page 3230) is that it allows you to take toolbars into account when converting between content and frame rectangles. (The toolbar is included in the frame rectangle but not the content rectangle.)

**Availability**

Available in Mac OS X v10.3 and later.

**See Also**

- [contentRectForFrameRect:](#) (page 3246)

NSWindow.h

## graphicsContext

Provides the graphics context associated with the window for the current thread.

- (NSGraphicsContext \*)graphicsContext

**Return Value**

The graphics context associated with the window for the current thread.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

NSWindow.h

## gState

Returns the window’s graphics state object.

- (NSInteger)gState

**Return Value**

The graphics state object associated with the window.

**Discussion**

This graphics state is used by default for all `NSView` objects in the window’s view hierarchy, but individual views can be made to use their own with the `NSView` method [allocateGState](#) (page 3098).

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindow.h

## hasDynamicDepthLimit

Indicates whether the window's depth limit can change to match the depth of the screen it's on.

- (BOOL)hasDynamicDepthLimit

### Return Value

YES when the window has a dynamic depth limit; NO otherwise.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [setDynamicDepthLimit:](#) (page 3310)

### Declared In

NSWindow.h

## hasShadow

Indicates whether the window has a shadow.

- (BOOL)hasShadow

### Return Value

YES when the window has a shadow; NO otherwise.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [setHasShadow:](#) (page 3316)

- [invalidateShadow](#) (page 3269)

### Declared In

NSWindow.h

## hidesOnDeactivate

Indicates whether the window is removed from the screen when its application becomes inactive.

- (BOOL)hidesOnDeactivate

### Return Value

YES if the window is removed from the screen when its application is deactivated; NO if it remains onscreen.

### Discussion

The default for `NSWindow` is NO; the default for `NSPanel` is YES.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [setHidesOnDeactivate:](#) (page 3316)

**Declared In**

NSWindow.h

**ignoresMouseEvents**

Indicates whether the window is transparent to mouse events.

- (BOOL)ignoresMouseEvents

**Return Value**

YES when the window is transparent to mouse events; NO otherwise.

**Availability**

Available in Mac OS X v10.2 and later.

**See Also**

- [setIgnoresMouseEvents:](#) (page 3317)

**Declared In**

NSWindow.h

**initialFirstResponder**

Returns view that's made first responder the first time the window is placed onscreen.

- (NSView \*)initialFirstResponder

**Return Value**

The view that's made first responder the first time the window is placed onscreen.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setInitialFirstResponder:](#) (page 3317)

- [setNextKeyView:](#) (page 3170) (NSView)

**Declared In**

NSWindow.h

**initWithContentRect:styleMask:backing:defer:**

Initializes the window with the specified values.

- (id)initWithContentRect:(NSRect)*contentRect* styleMask:(NSUInteger)*windowStyle*  
backing:(NSBackingStoreType)*bufferingType* defer:(BOOL)*deferCreation*

**Parameters**

*contentRect*

Location and size of the window's content area in screen coordinates. Note that the window server limits window position coordinates to  $\pm 16,000$  and sizes to 10,000.

*windowStyle*

The window's style. Either it can be `NSBorderlessWindowMask`, or it can contain any of the options described in “[Constants](#)” (page 3350), combined using the C bitwise OR operator. Borderless windows display none of the usual peripheral elements and are generally useful only for display or caching purposes; you should normally not need to create them. Also, note that a window's style mask should include `NSTitledWindowMask` if it includes any of the others.

*bufferingType*

Specifies how the drawing done in the window is buffered by the window device, and possible values are described in “[Constants](#)” (page 3350).

*deferCreation*

Specifies whether the window server creates a window device for the window immediately. When YES, the window server defers creating the window device until the window is moved onscreen. All display messages sent to the window or its views are postponed until the window is created, just before it's moved onscreen.

**Return Value**

The initialized window.

**Discussion**

This method is the designated initializer for the `NSWindow` class.

Deferring the creation of the window improves launch time and minimizes the virtual memory load on the window server.

The new window creates a view to be its default content view. You can replace it with your own object by using the [setContentView:](#) (page 3307) method.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [orderFront:](#) (page 3283)
- [setTitle:](#) (page 3326)

UIElementInspector

**Declared In**

`NSWindow.h`

**`initWithContentRect:styleMask:backing:defer:screen:`**

Initializes an allocated window with the specified values.

```
- (id)initWithContentRect:(NSRect)contentRect styleMask:(NSUInteger)windowStyle
 backing:(NSBackingStoreType)bufferingType defer:(BOOL)deferCreation
 screen:(NSScreen *)screen
```

**Parameters***contentRect*

Location and size of the window's content area in screen coordinates. Note that the window server limits window position coordinates to  $\pm 16,000$  and sizes to 10,000.

*windowStyle*

The window's style. It can be either `NSBorderlessWindowMask`, or it can contain any of the options described in [“Constants”](#) (page 3350), combined using the C bitwise OR operator. Borderless windows display none of the usual peripheral elements and are generally useful only for display or caching purposes; you should normally not need to create them. Also, note that a window's style mask should include `NSTitledWindowMask` if it includes any of the others.

*bufferingType*

Specifies how the drawing done in the window is buffered by the window device; possible values are described in [“Constants”](#) (page 3350).

*deferCreation*

Specifies whether the window server creates a window device for the window immediately. When YES, the window server defers creating the window device until the window is moved onscreen. All display messages sent to the window or its views are postponed until the window is created, just before it's moved onscreen.

*screen*

Specifies where the window's content rectangle is drawn if the window is to be drawn in a screen other than the main screen. The content rectangle is drawn relative to the bottom-left corner of screen. When nil, the content rectangle is drawn on the main screen.

**Return Value**

The initialized window.

**Discussion**

The main screen is the one that contains the current key window or, if there is no key window, the one that contains the main menu. If there's neither a key window nor a main menu (if there's no active application), the main screen is the one where the origin of the screen coordinate system is located.

**Availability**

Available in Mac OS X v10.0 and later.

- [setOneShot:](#) (page 3321)

**Declared In**

NSWindow.h

**initWithWindowRef:**

Returns a Cocoa window created from a Carbon window.

```
- (NSWindow *)initWithWindowRef:(void *)carbonWindowRef
```

**Parameters**

*carbonWindowRef*

The Carbon `WindowRef` object to use to create the Cocoa window.

**Return Value**

A Cocoa window created from *carbonWindowRef*.

**Discussion**

For more information on Carbon-Cocoa integration, see Using a Carbon User Interface in a Cocoa Application in *Carbon-Cocoa Integration Guide*.

**Special Considerations**

For historical reasons, contrary to normal memory management policy `initWithWindowRef:` does *not* retain *windowRef*. It is therefore recommended that you make sure you retain *windowRef* before calling this method. If *windowRef* is still valid when the Cocoa window is deallocated, the Cocoa window will release it.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [windowRef](#) (page 3336)

## invalidateShadow

Invalidates the window shadow so that it is recomputed based on the current window shape.

- (void)invalidateShadow

**Availability**

Available in Mac OS X v10.2 and later.

**See Also**

- [hasShadow](#) (page 3265)
- [setHasShadow:](#) (page 3316)

**Declared In**

NSWindow.h

## isAutodisplay

Indicates whether the window automatically displays views that need to be displayed.

- (BOOL)isAutodisplay

**Return Value**

YES when the window automatically displays views that need to be displayed; NO otherwise.

**Discussion**

Automatic display typically occurs on each pass through the event loop.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setAutodisplay:](#) (page 3300)
- [displayIfNeeded](#) (page 3256)
- [setNeedsDisplay:](#) (page 3169) (NSView)

**Declared In**

NSWindow.h

## isDocumentEdited

Indicates whether the window's document has been edited.

- (BOOL)isDocumentEdited

**Return Value**

YES when the window's document has been edited; NO otherwise.

**Discussion**

Initially, by default, NSWindow objects are in the “not edited” state.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindow.h

## isExcludedFromWindowsMenu

Indicates whether the window is excluded from the application's Windows menu.

- (BOOL)isExcludedFromWindowsMenu

### Return Value

YES when the window is excluded from the Windows menu; NO otherwise.

### Discussion

The default initial setting is NO.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [setExcludedFromWindowsMenu:](#) (page 3311)

### Declared In

NSWindow.h

## isFlushWindowDisabled

Indicates whether the window's flushing ability is disabled.

- (BOOL)isFlushWindowDisabled

### Return Value

YES when the window's flushing ability has been disabled; NO otherwise.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [disableFlushWindow](#) (page 3253)

- [enableFlushWindow](#) (page 3259)

### Declared In

NSWindow.h

## isKeyWindow

Indicates whether the window is the key window for the application.

- (BOOL)isKeyWindow

### Return Value

YES if the window is the key window for the application; NO otherwise.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [isMainWindow](#) (page 3272)

- [makeKeyWindow](#) (page 3278)

**Declared In**

NSWindow.h

## isMainWindow

Indicates whether the window is the application's main window.

- (BOOL)isMainWindow

**Return Value**

YES when the window is the main window for the application, NO otherwise.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [isKeyWindow](#) (page 3271)

- [makeMainWindow](#) (page 3279)

**Declared In**

NSWindow.h

## isMiniaturized

Indicates whether the window is minimized.

- (BOOL)isMiniaturized

**Return Value**

YES if the window is minimized, otherwise NO.

**Discussion**

A minimized window is removed from the screen and replaced by a image, icon, or button that represents it, called the counterpart.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [miniaturize:](#) (page 3279)

**Declared In**

NSWindow.h

## isMovableByWindowBackground

Indicates whether the window is movable by clicking and dragging anywhere in its background.

- (BOOL)isMovableByWindowBackground

**Return Value**

YES when the window is movable by clicking and dragging anywhere in its background; NO otherwise.

**Discussion**

A window with a style mask of `NSTexturedBackgroundWindowMask` is movable by background by default. Sheets and drawers cannot be movable by window background.

**Availability**

Available in Mac OS X v10.2 and later.

**See Also**

– [setMovableByWindowBackground:](#) (page 3320)

**Declared In**

NSWindow.h

## isOneShot

Indicates whether the window device the window manages is freed when it's removed from the screen list.

– (BOOL)isOneShot

**Return Value**

YES when the window's window device is freed when it's removed from the screen list; NO otherwise.

**Discussion**

The default is NO.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [setOneShot:](#) (page 3321)

**Declared In**

NSWindow.h

## isOpaque

Indicates whether the window is opaque.

– (BOOL)isOpaque

**Return Value**

YES when the window is opaque; NO otherwise.

**Discussion**

The default is YES.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [setOpaque:](#) (page 3321)

**Declared In**

NSWindow.h

## isReleasedWhenClosed

Indicates whether the window is released when it receives the `close` message.

- (BOOL)isReleasedWhenClosed

**Return Value**

YES if the window is automatically released after being closed; NO if it's simply removed from the screen.

**Discussion**

The default for `NSWindow` is YES; the default for `NSPanel` is NO. Release when closed, however, is ignored for windows owned by window controllers.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setReleasedWhenClosed:](#) (page 3323)

**Declared In**

NSWindow.h

## isSheet

Indicates whether the window has ever run as a modal sheet.

- (BOOL)isSheet

**Return Value**

YES if the window has ever run as a modal sheet, otherwise NO.

**Discussion**

Sheets are created using the `NSPanel` subclass.

**Availability**

Available in Mac OS X v10.1 and later.

**Declared In**

NSWindow.h

## isVisible

Indicates whether the window is visible onscreen (even when it's obscured by other windows).

- (BOOL)isVisible

**Return Value**

YES when the window is onscreen (even if it's obscured by other windows); NO otherwise.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [visibleRect](#) (page 3186) (NSView)

GLChildWindowDemo

SimpleCocoaJavaMovie

SimpleCocoaJavaMovieCocoa

**Declared In**

NSWindow.h

## isZoomed

Returns a Boolean value that indicates whether the window is in a zoomed state.

- (BOOL)isZoomed

**Return Value**

YES if the window is in a zoomed state, otherwise NO.

**Discussion**

The zoomed state of the window is determined using the following steps:

1. If the delegate or the window class implements [windowWillUseStandardFrame:defaultFrame:](#) (page 3349), it is invoked to obtain the zoomed frame of the window. The result of `isZoomed` is then determined by whether or not the current window frame is equal to the zoomed frame.
2. If the neither the delegate nor the window class implements [windowWillUseStandardFrame:defaultFrame:](#) (page 3349), a default frame that nearly fits the screen is chosen. If the delegate or window class implements [windowWillResize:toSize:](#) (page 3347), it is invoked to validate the proposed zoomed frame. Once the zoomed frame is validated, the result of `isZoomed` is determined by whether or not the current window frame is equal to the zoomed frame.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [zoom:](#) (page 3337)

**Declared In**

NSWindow.h

## keyDown:

Handles a given keyboard event that may need to be interpreted as changing the key view or triggering a keyboard equivalent.

- (void)keyDown:(NSEvent \*)event

**Parameters***event*

The keyboard event to process.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [selectNextKeyView:](#) (page 3296)
- [nextKeyView](#) (page 3140) (NSView)
- [performMnemonic:](#) (page 3143) (NSView)

**Declared In**

NSWindow.h

## keyViewSelectionDirection

Returns the direction the window is currently using to change the key view.

- (NSElectionDirection)keyViewSelectionDirection

**Return Value**

The direction the window is using to change the key view.

**Discussion**

This direction can be one of the values described in “[Constants](#)” (page 3350).

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [selectNextKeyView:](#) (page 3296)
- [selectPreviousKeyView:](#) (page 3297)

**Declared In**

NSWindow.h

## level

Returns the window level of the window.

- (NSInteger)level

**Return Value**

The window level.

**Discussion**

See “[Constants](#)” (page 3350) for a list of possible values.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setLevel:](#) (page 3317)

**Declared In**

NSWindow.h

## makeFirstResponder:

Attempts to make a given responder the first responder for the window.

- (BOOL)makeFirstResponder:(NSResponder \*)*responder*

**Parameters**

*responder*

The responder to set as the window's first responder. `nil` makes the window its first responder.

**Return Value**

YES when the operation is successful; NO otherwise.

**Discussion**

If *responder* isn't already the first responder, this method first sends a [resignFirstResponder](#) (page 2152) message to the object that is the first responder. If that object refuses to resign, it remains the first responder, and this method immediately returns NO. If the current first responder resigns, this method sends a [becomeFirstResponder](#) (page 2118) message to *responder*. If *responder* does not accept first responder status, the NSWindow object becomes first responder; in this case, the method returns YES even if *responder* refuses first responder status.

If *responder* is `nil`, this method still sends [resignFirstResponder](#) (page 2152) to the current first responder. If the current first responder refuses to resign, it remains the first responder and this method immediately returns NO. If the current first responder returns YES from [resignFirstResponder](#), the window is made its own first responder and this method returns YES.

The Application Kit framework uses this method to alter the first responder in response to mouse-down events; you can also use it to explicitly set the first responder from within your program. The *responder* object is typically an NSView object in the window's view hierarchy. If this method is called explicitly, first send [acceptsFirstResponder](#) (page 2117) to *responder*, and do not call `makeFirstResponder:` if [acceptsFirstResponder](#) returns NO.

Use [setInitialFirstResponder:](#) (page 3317) to set the first responder to be used when the window is brought onscreen for the first time.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [becomeFirstResponder](#) (page 2118) (NSResponder)  
- [resignFirstResponder](#) (page 2152) (NSResponder)

NSWindow.h

## mouseLocationOutsideOfEventStream

Returns the current location of the pointer reckoned in the window's base coordinate system.

- (NSPoint)mouseLocationOutsideOfEventStream

**Return Value**

The current location of the pointer reckoned in the window's base coordinate system, regardless of the current event being handled or of any events pending.

**Discussion**

For the same information in screen coordinates, use NSEvent's [mouseLocation](#) (page 1060).

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [currentEvent](#) (page 147) (NSApplication)

**Declared In**

NSWindow.h

## nextEventMatchingMask:

Returns the next event matching a given mask.

- (NSEvent \*)nextEventMatchingMask:(NSUInteger)eventMask

**Parameters**

*eventMask*

The mask that the event to return must match. Events with nonmatching masks are removed from the queue. See [discardEventsMatchingMask:beforeEvent:](#) (page 148) in NSApplication for the list of mask values.

**Return Value**

The next event whose mask matches *eventMask*; *nil* when no matching event was found.

**Discussion**

This method sends the message `nextEventMatchingMask:eventMask untilDate:[NSDate distantFuture] inMode:NSEventTrackingRunLoopMode dequeue:YES` to the application (NSApp).

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [nextEventMatchingMask:untilDate:inMode:dequeue:](#) (page 156) (NSApplication)

**Related Sample Code**

Sketch-112

**Declared In**

NSWindow.h

**nextEventMatchingMask:untilDate:inMode:dequeue:**

Forwards the message to the global NSApplication object, NSApp.

```
- (NSEvent *)nextEventMatchingMask:(NSUInteger)eventMask untilDate:(NSDate *)expirationDate inMode:(NSString *)runLoopMode dequeue:(BOOL)dequeue
```

**Parameters**

*eventMask*

The mask that the event to return must match.

*expirationDate*

The date until which to wait for events.

*runLoopMode*

The run loop mode to use while waiting for events

*dequeue*

YES to remove the returned event from the event queue; NO to leave the returned event in the queue.

**Return Value**

The next event whose mask matches *eventMask*; *nil* when no matching event was found.

**Availability**

Available in Mac OS X v10.0 and later.

## orderFrontRegardless

Moves the window to the front of its level, even if its application isn't active, without changing either the key window or the main window.

- (void)orderFrontRegardless

**Parameters**

*sender*

The message's sender.

**Discussion**

Normally an `NSWindow` object can't be moved in front of the key window unless it and the key window are in the same application. You should rarely need to invoke this method; it's designed to be used when applications are cooperating in such a way that an active application (with the key window) is using another application to display data.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [orderFront:](#) (page 3283)
- [level](#) (page 3276)

**Declared In**

NSWindow.h

## orderOut:

Removes the window from the screen list, which hides the window.

- (void)orderOut:(id) *sender*

**Parameters**

*sender*

The message's sender.

**Discussion**

If the window is the key or main window, the `NSWindow` object immediately behind it is made key or main in its place. Calling the [orderOut:](#) (page 3284) method causes the window to be removed from the screen, but does not cause it to be released. See the [close](#) (page 3243) method for information on when a window is released.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [orderFront:](#) (page 3283)
- [orderBack:](#) (page 3283)
- [orderWindow:relativeTo:](#) (page 3285)

- [setReleasedWhenClosed:](#) (page 3323)

**Related Sample Code**

EnhancedDataBurn

GridCalendar

ImageClient

Quartz Composer WWDC 2005 TextEdit

TextEditPlus

**Declared In**

NSWindow.h

**orderWindow:relativeTo:**

Repositions the window's window device in the window server's screen list.

- (void)orderWindow:(NSWindowOrderingMode)*orderingMode*  
relativeTo:(NSInteger)*otherWindowNumber*

**Parameters***orderingMode*

NSWindowOut: The window is removed from the screen list and *otherWindowNumber* is ignored.

NSWindowAbove: The window is ordered immediately in front of the window whose window number is *otherWindowNumber*

NSWindowBelow: The window is placed immediately behind the window represented by *otherWindowNumber*.

*otherWindowNumber*

The number of the window the window is to be placed in front of or behind. Pass 0 to place the window in front of (when *orderingMode* is NSWindowAbove) or behind (when *orderingMode* is NSWindowBelow) all other windows in its level.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [orderFront:](#) (page 3283)
- [orderBack:](#) (page 3283)
- [orderOut:](#) (page 3284)

**Declared In**

NSWindow.h

**parentWindow**

Returns the parent window to which the window is attached as a child.

- (NSWindow \*)parentWindow

**Return Value**

The window to which the window is attached as a child.

**Availability**

Available in Mac OS X v10.2 and later.

**See Also**

- [removeChildWindow:](#) (page 3290)
- [childWindows](#) (page 3243)
- [addChildWindow:ordered:](#) (page 3233)
- [setParentWindow:](#) (page 3322)

**Related Sample Code**

FunkyOverlayWindow

GLChildWindowDemo

**Declared In**

NSWindow.h

**performClose:**

This action method simulates the user clicking the close button by momentarily highlighting the button and then closing the window.

- (void)performClose:(id)sender

**Parameters**

*sender*

The message's sender.

**Discussion**

If the window's delegate or the window itself implements [windowShouldClose:](#) (page 3345), that message is sent with the window as the argument. (Only one such message is sent; if both the delegate and the NSWindow object implement the method, only the delegate receives the message.) If the [windowShouldClose:](#) (page 3345) method returns NO, the window isn't closed. If it returns YES, or if it isn't implemented, [performClose:](#) (page 3286) invokes the [close](#) (page 3243) method to close the window.

If the window doesn't have a close button or can't be closed (for example, if the delegate replies NO to a [windowShouldClose:](#) (page 3345) message), the system emits the alert sound.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [styleMask](#) (page 3331)
- [performMiniaturize:](#) (page 3287)

**Related Sample Code**

QTMetadataEditor

**Declared In**

NSWindow.h

## performMiniaturize:

Simulates the user clicking the minimize button by momentarily highlighting the button, then minimizing the window.

- (void)performMiniaturize:(id)sender

### Parameters

*sender*

The message's sender.

### Discussion

If the window doesn't have a minimize button or can't be minimized for some reason, the system emits the alert sound.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [close](#) (page 3243)
- [styleMask](#) (page 3331)
- [performClose:](#) (page 3286)

### Declared In

NSWindow.h

## performZoom:

This action method simulates the user clicking the zoom box by momentarily highlighting the button and then zooming the window.

- (void)performZoom:(id)sender

### Parameters

*sender*

The object sending the message.

### Discussion

If the window doesn't have a zoom box or can't be zoomed for some reason, the computer beeps.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [styleMask](#) (page 3331)
- [zoom:](#) (page 3337)

### Declared In

NSWindow.h

## postEvent:atStart:

Forwards the message to the global `NSApplication` object, `NSApp`.

```
- (void)postEvent:(NSEvent *)event atStart:(BOOL)atStart
```

**Parameters**

*event*

The event to add to the window's event queue.

*atStart*

YES to place the event in the front of the queue; NO to place it in the back.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [postEvent:atStart:](#) (page 160)

**Declared In**

NSWindow.h

**preferredBackingLocation**

Indicates the preferred location for the window's backing store.

```
- (NSWindowBackingLocation)preferredBackingLocation
```

**Return Value**

The preferred location for the window's backing store. See “[Constants](#)” (page 3350) for possible values.

**Availability**

Available in Mac OS X v10.5 and later.

**See Also**

- [setPreferredBackingLocation:](#) (page 3322)

- [backingLocation](#) (page 3237)

**Declared In**

NSWindow.h

**preservesContentDuringLiveResize**

Returns a Boolean value that indicates whether the window tries to optimize live resize operations by preserving the content of views that have not changed.

```
- (BOOL)preservesContentDuringLiveResize
```

**Return Value**

YES if the window tries to optimize live resize operations by preserving the content of views that have not moved; NO otherwise.

**Discussion**

When live-resize optimization is active, the window redraws only those views that moved (or do not support this optimization) during a live resize operation.

See [preservesContentDuringLiveResize](#) (page 3144) in `NSView` for additional information on how to support this optimization.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [setPreservesContentDuringLiveResize:](#) (page 3323)
- [preservesContentDuringLiveResize](#) (page 3144) (NSView)

**Declared In**

NSWindow.h

**print:**

This action method runs the Print panel, and if the user chooses an option other than canceling, prints the window (its frame view and all subviews).

- (void)print:(id)sender

**Parameters**

*sender*

The message's sender.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindow.h

**recalculateKeyViewLoop**

Marks the key view loop as dirty and in need of recalculation.

- (void)recalculateKeyViewLoop

**Discussion**

The key view loop is actually recalculated the next time someone requests the next or previous key view of the window. The recalculated loop is based on the geometric order of the views in the window.

If you do not want to maintain the key view loop of your window manually, you can use this method to do it for you. When it is first loaded, `NSWindow` calls this method automatically if your window does not have a key view loop already established. If you add or remove views later, you can call this method manually to update the window's key view loop. You can also call [setAutorecalculatesKeyViewLoop:](#) (page 3301) to have the window recalculate the loop automatically.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [selectKeyViewFollowingView:](#) (page 3295)
- [selectKeyViewPrecedingView:](#) (page 3296)
- [setAutorecalculatesKeyViewLoop:](#) (page 3301)

**Declared In**

NSWindow.h

## registerForDraggedTypes:

Registers a give set of pasteboard types as the pasteboard types the window will accept as the destination of an image-dragging session.

- (void)registerForDraggedTypes:(NSArray \*)*pasteboardTypes*

### Parameters

*pasteboardTypes*

An array of the pasteboard types the window will accept as the destination of an image-dragging session.

### Discussion

Registering an `NSWindow` object for dragged types automatically makes it a candidate destination object for a dragging session. `NSWindow` has a default implementation for many of the methods in the `NSDraggingDestination` informal protocol. The default implementation forwards each message to the delegate if the delegate responds to the selector of the message. The messages forwarded this way are [draggingEntered:](#) (page 3499), [draggingUpdated:](#) (page 3500), [draggingExited:](#) (page 3499), [prepareForDragOperation:](#) (page 3501), [performDragOperation:](#) (page 3501), and [concludeDragOperation:](#) (page 3498).

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [unregisterDraggedTypes](#) (page 3333)

### Declared In

`NSWindow.h`

## removeChildWindow:

Detaches a given child window from the window.

- (void)removeChildWindow:(NSWindow \*)*childWindow*

### Parameters

*childWindow*

The child window to detach.

### Availability

Available in Mac OS X v10.2 and later.

### See Also

- [addChildWindow:ordered:](#) (page 3233)  
- [childWindows](#) (page 3243)  
- [parentWindow](#) (page 3285)  
- [setParentWindow:](#) (page 3322)

### Declared In

`NSWindow.h`

## representedFilename

Returns the pathname of the file the window represents.

- (NSString \*)representedFilename

### Return Value

The path to the file of the window’s represented file.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [setRepresentedFilename:](#) (page 3324)

### Declared In

NSWindow.h

## representedURL

Provides the URL of the file the window represents.

- (NSURL \*)representedURL

### Return Value

The URL for the file the window represents.

### Discussion

When the URL specifies a path, the window shows an icon in its title bar, as described in Table 171-1.

**Table 171-1** Title bar document icon display

| Filepath                     | Document icon                 |
|------------------------------|-------------------------------|
| Empty                        | None.                         |
| Specifies a nonexistent file | Generic.                      |
| Specifies an existent file   | Specific for the file’s type. |

You can customize the file icon in the tile bar with the following code:

```
[[<window> standardWindowButton:NSWindowDocumentIconButton] setImage:<image>]
```

When the URL identifies an existing file, the window’s title offers a pop-up menu showing the path components of the URL. (The user displays this menu by Command-clicking the title.) The behavior and contents of this menu can be controlled with [window:shouldPopUpDocumentPathMenu:](#) (page 3339).

### Availability

Available in Mac OS X v10.5 and later.

### See Also

- [setRepresentedURL:](#) (page 3324)

- [window:shouldDragDocumentWithEvent:from:withPasteboard:](#) (page 3338)

**Declared In**

NSWindow.h

## resetCursorRects

Clears the window's cursor rectangles and the cursor rectangles of the `NSView` objects in its view hierarchy.

- (void)resetCursorRects

**Discussion**

Invokes [discardCursorRects](#) (page 3255) to clear the window's cursor rectangles, then sends [resetCursorRects](#) (page 3292) to every `NSView` object in the window's view hierarchy.

This method is typically invoked by the `NSApplication` object when it detects that the key window's cursor rectangles are invalid. In program code, it's more efficient to invoke [invalidateCursorRectsForView:](#) (page 3269).

**Availability**

Available in Mac OS X v10.0 and later.

**Related Sample Code**

TextLinks

**Declared In**

NSWindow.h

## resignKeyWindow

Invoked automatically when the window resigns key window status; never invoke this method directly.

- (void)resignKeyWindow

**Discussion**

This method sends [resignKeyWindow](#) (page 3292) to the window's first responder, sends [windowDidResignKey:](#) (page 3344) to the window's delegate, and posts an [NSWindowDidResignKeyNotification](#) (page 3363) to the default notification center.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [becomeKeyWindow](#) (page 3238)
- [resignMainWindow](#) (page 3292)

**Declared In**

NSWindow.h

## resignMainWindow

Invoked automatically when the window resigns main window status; never invoke this method directly.

- (void)resignMainWindow

**Discussion**

This method sends [windowDidResignKeyMain:](#) (page 3344) to the window's delegate and posts an [NSWindowDidResignKeyMainNotification](#) (page 3363) to the default notification center.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [becomeMainWindow](#) (page 3238)
- [resignKeyWindow](#) (page 3292)

**Declared In**

NSWindow.h

## resizeFlags

Returns the flags field of the event record for the mouse-down event that initiated the resizing session.

- (NSInteger)resizeFlags

**Return Value**

A mask indicating which of the modifier keys was held down when the mouse-down event occurred. The flags are listed in NSEvent object's [modifierFlags](#) (page 1073) method description.

**Discussion**

This method is valid only while the window is being resized

You can use this method to constrain the direction or amount of resizing. Because of its limited validity, this method should only be invoked from within an implementation of the delegate method [windowWillResize:toSize:](#) (page 3347).

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindow.h

## resizeIncrements

Returns the window's resizing increments.

- (NSSize)resizeIncrements

**Return Value**

The window's resizing increments.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setResizeIncrements:](#) (page 3325)
- [setAspectRatio:](#) (page 3299)
- [setFrame:display:](#) (page 3311)

**Declared In**

NSWindow.h

**restoreCachedImage**

Splices the window's cached image rectangles, if any, back into its raster image (and buffer if it has one), undoing the effect of any drawing performed within those areas since they were established using [cacheImageInRect:](#) (page 3238).

- (void)restoreCachedImage

**Discussion**

You must invoke [flushWindow](#) (page 3262) after this method to guarantee proper redisplay. An `NSWindow` object automatically discards its cached image rectangles when it displays.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [discardCachedImage](#) (page 3254)
- [display](#) (page 3255)

**Declared In**

NSWindow.h

**runToolbarCustomizationPalette:**

The action method for the “Customize Toolbar...” menu item.

- (void)runToolbarCustomizationPalette:(id)sender

**Parameters**

*sender*

The message's sender.

**Discussion**

See the `NSToolbar` class description for additional information.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindow.h

**saveFrameUsingName:**

Saves the window's frame rectangle in the user defaults system under a given name.

- (void)saveFrameUsingName:(NSString \*)frameName

**Parameters***frameName*

The name under which the frame is to be saved.

**Discussion**

With the companion method [setFrameUsingName:](#) (page 3315), you can save and reset an `NSWindow` object's frame over various launches of an application. The default is owned by the application and stored under the name "NSWindow Frame *frameName*". See `NSUserDefaults` for more information.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [stringWithSavedFrame](#) (page 3330)

**Declared In**

`NSWindow.h`

**screen**

Returns the screen the window is on.

- (NSScreen \*)screen

**Return Value**

The screen where most of the window is on; `nil` when the window is offscreen.

**Discussion**

When the window is partly on one screen and partly on another, the screen where most of it lies is returned.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [deepestScreen](#) (page 3250)

**Related Sample Code**

CocoaDVDPlayer

iSpend

QTQuartzPlayer

**Declared In**

`NSWindow.h`

**selectKeyViewFollowingView:**

Makes key the view that follows the given view.

- (void)selectKeyViewFollowingView:(NSView \*)referenceView

**Parameters***referenceView*

The view whose following view in the key view loop is sought.

**Discussion**

Sends the [nextValidKeyView](#) (page 3140) message to *referenceView* and, if that message returns an *NSView* object, invokes [makeFirstResponder:](#) (page 3277) with the returned object.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [selectKeyViewPrecedingView:](#) (page 3296)

**Declared In**

*NSWindow.h*

**selectKeyViewPrecedingView:**

Makes key the view that precedes the given view.

```
– (void)selectKeyViewPrecedingView:(NSView *)referenceView
```

**Parameters**

*referenceView*

The view whose preceding view in the key view loop is sought.

**Discussion**

Sends the [previousValidKeyView](#) (page 3145) message to *referenceView* and, if that message returns an *NSView* object, invokes [makeFirstResponder:](#) (page 3277) with the returned object.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [selectKeyViewFollowingView:](#) (page 3295)

**Declared In**

*NSWindow.h*

**selectNextKeyView:**

This action method searches for a candidate next key view and, if it finds one, invokes [makeFirstResponder:](#) (page 3277) to establish it as the first responder.

```
– (void)selectNextKeyView:(id)sender
```

**Parameters**

*sender*

The message's sender.

**Discussion**

The candidate is one of the following (searched for in this order):

- The current first responder's next valid key view, as returned by the [nextValidKeyView](#) (page 3140) method of *NSView*

- The object designated as the window's initial first responder (using [setInitialFirstResponder:](#) (page 3317)) if it returns YES to an [acceptsFirstResponder](#) (page 2117) message
- Otherwise, the initial first responder's next valid key view, which may end up being nil

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [selectPreviousKeyView:](#) (page 3297)
- [selectKeyViewFollowingView:](#) (page 3295)

**Declared In**

NSWindow.h

## selectPreviousKeyView:

This action method searches for a candidate previous key view and, if it finds one, invokes [makeFirstResponder:](#) (page 3277) to establish it as the first responder.

- (void)selectPreviousKeyView:(id)sender

**Parameters**

*sender*

The message's sender.

**Discussion**

The candidate is one of the following (searched for in this order):

- The current first responder's previous valid key view, as returned by the [previousValidKeyView](#) (page 3145) method of `NSView`
- The object designated as the window's initial first responder (using [setInitialFirstResponder:](#) (page 3317)) if it returns YES to an [acceptsFirstResponder](#) (page 2117) message
- Otherwise, the initial first responder's previous valid key view, which may end up being nil

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [selectNextKeyView:](#) (page 3296)
- [selectKeyViewPrecedingView:](#) (page 3296)

**Declared In**

NSWindow.h

## sendEvent:

This action method dispatches mouse and keyboard events sent to the window by the `NSApplication` object.

- (void)sendEvent:(NSEvent \*)event

**Parameters***event*

The mouse or keyboard event to process.

**Discussion**

Never invoke this method directly. A right mouse-down event in a window of an inactive application is not delivered to the corresponding `NSWindow` object. It is instead delivered to the `NSApplication` object through a [sendEvent:](#) (page 167) message with a window number of 0.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSWindow.h`

**setAcceptsMouseMovedEvents:**

Specifies whether the window is to accept mouse-moved events.

- (void)setAcceptsMouseMovedEvents:(BOOL)acceptMouseMovedEvents

**Parameters***acceptMouseMovedEvents*

YES to have the window accept mouse-moved events (and to distribute them to its responders); NO to not accept such events.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [acceptsMouseMovedEvents](#) (page 3232)

**Declared In**

`NSWindow.h`

**setAllowsToolTipsWhenApplicationIsInactive:**

Specifies whether the window can display tooltips even when the application is in the background.

- (void)setAllowsToolTipsWhenApplicationIsInactive:(BOOL)allowTooltipsWhenAppInactive

**Parameters***allowTooltipsWhenAppInactive*

YES to have the window display tooltips even when its application is inactive; NO to suppress tooltip display when inactive.

**Discussion**

The message does not take effect until the window changes to an active state.

**Note:** Enabling tooltips in an inactive application will cause the application to do work any time the pointer passes over the window, thus degrading system performance.

**Availability**

Available in Mac OS X v10.3 and later.

**See Also**

- [allowsToolTipsWhenApplicationIsInactive](#) (page 3233)

**Declared In**

NSWindow.h

**setAlphaValue:**

Applies a given alpha value to the entire window.

- (void)setAlphaValue:(CGFloat)windowAlpha

**Parameters**

*windowAlpha*

The alpha value to apply.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [alphaValue](#) (page 3234)

**Related Sample Code**

FunkyOverlayWindow

JavaSplashScreen

RoundTransparentWindow

UIElementInspector

**Declared In**

NSWindow.h

**setAspectRatio:**

Sets the window's aspect ratio, which constrains the size of its frame rectangle to integral multiples of this ratio when the user resizes it.

- (void)setAspectRatio:(NSSize)aspectRatio

**Parameters**

*aspectRatio*

The aspect ratio to be maintained during resizing actions.

**Discussion**

An `NSWindow` object's aspect ratio and its resize increments are mutually exclusive attributes. In fact, setting one attribute cancels the setting of the other. For example, to cancel an established aspect ratio setting for an `NSWindow` object, you send it a `setResizeIncrements:` (page 3325) message with the width and height set to 1.0:

```
[myWindow setResizeIncrements:NSMakeRange(1.0,1.0)];
```

The `setContentAspectRatio:` (page 3304) method takes precedence over this method.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [aspectRatio](#) (page 3235)
- [setFrame:display:](#) (page 3311)

**Declared In**

`NSWindow.h`

**setAutodisplay:**

Specifies whether the window is to automatically display the views that are marked as needing it.

```
- (void)setAutodisplay:(BOOL)autodisplay
```

**Parameters**

*autodisplay*

YES to have the window automatically display views that need to be displayed; NO to specify otherwise.

**Discussion**

If *autodisplay* is NO, the window or its views must be explicitly displayed.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [isAutodisplay](#) (page 3270)
- [displayIfNeeded](#) (page 3256)
- [displayIfNeeded](#) (page 3115) (`NSView`)

**Declared In**

`NSWindow.h`

**setAutorecalculatesContentBorderThickness:forEdge:**

Specifies whether the window calculates the thickness of a given border automatically.

```
- (void)setAutorecalculatesContentBorderThickness:(BOOL)autorecalculateContentBorderThickness
forEdge:(NSRectEdge)edge
```

**Parameters***autorecalculateContentBorderThickness*

YES to have the window calculate the thickness of edge automatically; NO otherwise.

*edge*

Border whose thickness autorecalculation status to set:

- NSMaxYEdge: Top border.
- NSMinYEdge: Bottom border.

**Special Considerations**

Turning off a border's autorecalculation status sets its border thickness to 0.0.

**Availability**

Available in Mac OS X v10.5 and later.

**See Also**

- [autorecalculatesContentBorderThicknessForEdge:](#) (page 3236)
- [contentBorderThicknessForEdge:](#) (page 3245)

**Declared In**

NSWindow.h

**setAutorecalculatesKeyViewLoop:**

Specifies whether to recalculate the key view loop automatically when views are added or removed.

- (void)setAutorecalculatesKeyViewLoop:(BOOL)autorecalculateKeyViewLoop

**Parameters***autorecalculateKeyViewLoop*

YES to recalculate the key view loop automatically; NO otherwise.

**Discussion**

If *autorecalculateKeyViewLoop* is NO, the client code must update the key view loop manually or call [recalculateKeyViewLoop](#) (page 3289) to have the window recalculate it.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [autorecalculatesKeyViewLoop](#) (page 3236)
- [recalculateKeyViewLoop](#) (page 3289)

**Declared In**

NSWindow.h

**setBackgroundColor:**

Sets the window's background color to the given color.

- (void)setBackgroundColor:(NSColor \*)color

**Parameters***color*

Color to set as the window's background color.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [backgroundColor](#) (page 3237)

**Related Sample Code**

JavaSplashScreen

RoundTransparentWindow

UIElementInspector

**Declared In**

NSWindow.h

**setBackingType:**

Sets the window's backing store type to a given type.

– (void)setBackingType:(NSBackingStoreType)*backingType*

**Parameters***backingType*

The backing store type to set.

**Discussion**

The valid backing store types are described in “[Constants](#)” (page 3350).

This method can be used only to switch a buffered window to retained or vice versa; you can't change the backing type to or from nonretained after initializing an `NSWindow` object (an error is generated if you attempt to do so).

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [backingType](#) (page 3237)

– [initWithContentRect:styleMask:backing:defer:](#) (page 3266)

– [initWithContentRect:styleMask:backing:defer:screen:](#) (page 3267)

**Declared In**

NSWindow.h

**setCanBecomeVisibleWithoutLogin:**

Specifies whether the window can be displayed at the login window.

– (void)setCanBecomeVisibleWithoutLogin:(BOOL)*canBecomeVisibleWithoutLogin*

**Parameters**

*canBecomeVisibleWithoutLogin*

YES to allow the window to be displayed at the login window; NO to prevent this behavior.

**Availability**

Available in Mac OS X v10.5 and later.

**See Also**

– [canBecomeVisibleWithoutLogin](#) (page 3240)

**Declared In**

NSWindow.h

**setCanBeVisibleOnAllSpaces:**

Specifies whether the window can be visible on all spaces or on only one space at a time. (Deprecated in Mac OS X v10.5.)

– (void)setCanBeVisibleOnAllSpaces:(BOOL)flag

**Parameters**

*flag*

YES specifies that the window can be visible on all spaces; NO specifies that the window can be visible on only one space at a time.

**Availability**

Available in Mac OS X v10.5 and later.

Deprecated in Mac OS X v10.5.

**Declared In**

NSWindow.h

**setCanHide:**

Specifies whether the window can be hidden when its application becomes hidden (during execution of the `NSApplication hide:` (page 151) method).

– (void)setCanHide:(BOOL)canHide

**Parameters**

*canHide*

YES specifies that the window can be hidden when its application becomes hidden; NO specifies otherwise.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [canHide](#) (page 3241)

**Declared In**

NSWindow.h

## setCollectionBehavior:

Specifies the window's behavior in window collections.

```
- (void)setCollectionBehavior:(NSWindowCollectionBehavior)collectionBehavior;
```

### Parameters

*collectionBehavior*

The collection behavior identifier to set.

### Availability

Available in Mac OS X v10.5 and later.

### See Also

- [collectionBehavior](#) (page 3244)

### Declared In

NSWindow.h

## setContentAspectRatio:

Sets the aspect ratio (height in relation to width) of the window's content view, constraining the dimensions of its content rectangle to integral multiples of that ratio when the user resizes it.

```
- (void)setContentAspectRatio:(NSSize)contentAspectRatio
```

### Parameters

*contentAspectRatio*

The aspect ratio of the window's content view.

### Discussion

You can set a window's content view to any size programmatically, regardless of its aspect ratio. This method takes precedence over [setAspectRatio:](#) (page 3299).

### Availability

Available in Mac OS X v10.3 and later.

### See Also

- [contentAspectRatio](#) (page 3245)

### Declared In

NSWindow.h

## setContentBorderThickness:forEdge:

Specifies the thickness of a given border of the window.

```
- (void)setContentBorderThickness:(CGFloat)borderThickness forEdge:(NSRectEdge)edge
```

### Parameters

*borderThickness*

Thickness for *edge*, in points.

*edge*

Border whose thickness to set:

- `NSMaxYEdge`: Top border.
- `NSMinYEdge`: Bottom border.

**Availability**

Available in Mac OS X v10.5 and later.

**See Also**

– [contentBorderThicknessForEdge:](#) (page 3245)

**Declared In**

`NSWindow.h`

**setContentMaxSize:**

Sets the maximum size of the window's content view in the window's base coordinate system.

– `(void)setContentMaxSize:(NSSize)contentMaxSize`

**Parameters**

*contentMaxSize*

The maximum size of the window's content view in the window's base coordinate system.

**Discussion**

The maximum size constraint is enforced for resizing by the user as well as for the [setContentSize:](#) (page 3306) method and the `setFrame...` methods other than `setFrame:display:` (page 3311). This method takes precedence over [setMaxSize:](#) (page 3318).

**Availability**

Available in Mac OS X v10.3 and later.

**See Also**

- [contentMaxSize](#) (page 3246)
- [setContentMinSize:](#) (page 3305)

**Declared In**

`NSWindow.h`

**setContentMinSize:**

Sets the minimum size of the window's content view in the window's base coordinate system.

– `(void)setContentMinSize:(NSSize)contentMinSize`

**Parameters**

*contentMinSize*

The minimum size of the window's content view in the window's base coordinate system.

**Discussion**

The minimum size constraint is enforced for resizing by the user as well as for the `setContentSize:` (page 3306) method and the `setFrame...` methods other than `setFrame:display:` (page 3311). This method takes precedence over `setMinSize:` (page 3320).

**Availability**

Available in Mac OS X v10.3 and later.

**See Also**

- `contentMinSize` (page 3246)
- `setContentMaxSize:` (page 3305)

**Declared In**

NSWindow.h

**setContentResizeIncrements:**

Restricts the user's ability to resize the window so the width and height of its content view change by multiples of width and height increments.

```
- (void)setContentResizeIncrements:(NSSize)contentResizeIncrements
```

**Parameters**

*contentResizeIncrements*

The content-view resizing increments to set.

**Discussion**

As the user resizes the window, the size of its content view changes by integral multiples of *contentResizeIncrements.width* and *contentResizeIncrements.height*. However, you can set a window's size to any width and height programmatically. This method takes precedence over `setResizeIncrements:` (page 3325).

**Availability**

Available in Mac OS X v10.3 and later.

**See Also**

- `contentResizeIncrements` (page 3247)

**Declared In**

NSWindow.h

**setContentSize:**

Sets the size of the window's content view to a given size, which is expressed in the window's base coordinate system.

```
- (void)setContentSize:(NSSize)size
```

**Parameters**

*size*

The new size of the window's content view in the window's base coordinate system.

**Discussion**

This size in turn alters the size of the `NSWindow` object itself. Note that the window server limits window sizes to 10,000; if necessary, be sure to limit *size* relative to the frame rectangle.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setFrame:display:](#) (page 3311)
- + [contentRectForFrameRect:styleMask:](#) (page 3229)
- + [frameRectForContentRect:styleMask:](#) (page 3230)

**Related Sample Code**

CocoaDVDPlayer  
CocoaVideoFrameToGWorld  
Quartz Composer WWDC 2005 TextEdit  
TextEditPlus  
VideoViewer

**Declared In**

`NSWindow.h`

**setContentView:**

Makes a given view the window's content view.

```
- (void)setContentView:(NSView *)view
```

**Parameters**

*view*

View that is to become the window's content view.

**Discussion**

The window retains the new content view and owns it thereafter. The *view* object is resized to fit precisely within the content area of the window. You can modify the content view's coordinate system through its bounds rectangle, but can't alter its frame rectangle (that is, its size or location) directly.

This method causes the old content view to be released; if you plan to reuse it, be sure to retain it before sending this message and to release it as appropriate when adding it to another `NSWindow` object or `NSView`.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [contentView](#) (page 3247)
- [setContentSize:](#) (page 3306)

**Related Sample Code**

CustomSave  
FunkyOverlayWindow  
GLChildWindowDemo

**Declared In**

NSWindow.h

**setDefaultButtonCell:**

Makes the key equivalent of button cell the Return (or Enter) key, so when the user presses Return that button performs as if clicked.

```
- (void)setDefaultButtonCell:(NSButtonCell *)defaultButtonCell
```

**Parameters***defaultButtonCell*

The button cell to perform as if clicked when the window receives a Return (or Enter) key event.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [defaultButtonCell](#) (page 3250)
- [disableKeyEquivalentForDefaultButtonCell](#) (page 3254)
- [enableKeyEquivalentForDefaultButtonCell](#) (page 3259)

**Declared In**

NSWindow.h

**setDelegate:**

Sets the window's delegate to a given object or removes an existing delegate.

```
- (void)setDelegate:(id)delegate
```

**Parameters***delegate*

The delegate for the window. Pass `nil` to remove an existing delegate.

**Discussion**

An `NSWindow` object's delegate is inserted in the responder chain after the window itself and is informed of various actions by the window through delegation messages.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [delegate](#) (page 3251)
- [tryToPerform:with:](#) (page 3332)
- [sendAction:to:from:](#) (page 167) (`NSApplication`)

**Related Sample Code**

DataBurn

Eraser

Quartz Composer WWDC 2005 TextEdit

TextEditPlus

**Declared In**

NSWindow.h

**setDepthLimit:**

Sets the depth limit of the window to a given limit.

- (void)setDepthLimit:(NSWindowDepth)*depthLimit*

**Parameters**

*depthLimit*

The depth limit to set.

**Discussion**

The [NSBestDepth](#) (page 3661) function provides the best depth limit based on a set of parameters.

Passing a value of 0 for *depthLimit* sets the depth limit to the window's default depth limit. A depth limit of 0 can be useful for reverting an `NSWindow` object to its initial depth.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [depthLimit](#) (page 3252)
- + [defaultDepthLimit](#) (page 3229)
- [setDynamicDepthLimit:](#) (page 3310)

**Declared In**

NSWindow.h

**setDisplayWhenScreenProfileChanges:**

Specifies whether the window context should be updated when the screen profile changes.

- (void)setDisplaysWhenScreenProfileChanges:(BOOL)*displaysWhenScreenProfileChanges*

**Parameters**

*displaysWhenScreenProfileChanges*

- YES specifies that the window context should be changed in these situations:
  - ☐ A majority of the window is moved to a different screen whose profile is different than the previous screen.
  - ☐ The ColorSync profile of the current screen changes.
- NO specifies that the screen profile information for the window context doesn't change.

**Discussion**

After the window context is updated, the window is told to display itself. If you need to update offscreen caches for the window, you should register to receive the [NSWindowDidChangeScreenProfileNotification](#) (page 3361) notification.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [displaysWhenScreenProfileChanges](#) (page 3256)

**Declared In**

NSWindow.h

**setDocumentEdited:**

Specifies whether the window's document has been edited.

- (void)setDocumentEdited:(BOOL)*documentEdited*

**Parameters**

*documentEdited*

YES to specify that the window's document has been edited; NO to specify otherwise.

**Discussion**

You should send `setDocumentEdited:YES` to an `NSWindow` object every time the window's document changes in such a way that it needs to be saved. Conversely, when the document is saved, you should send `setDocumentEdited:NO`. Then, before closing the window you can use [isDocumentEdited](#) (page 3270) to determine whether to allow the user a chance to save the document.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindow.h

**setDynamicDepthLimit:**

Sets whether the window changes its depth to match the depth of the screen it's on, or the depth of the deepest screen when it spans multiple screens.

- (void)setDynamicDepthLimit:(BOOL)*dynamicDepthLimit*

**Parameters**

*dynamicDepthLimit*

YES specifies a dynamic depth limit; NO specifies otherwise.

**Discussion**

When *dynamicDepthLimit* is NO, the window uses either its preset depth limit or the default depth limit. A different, and nondynamic, depth limit can be set with the [setDepthLimit:](#) (page 3309) method.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [hasDynamicDepthLimit](#) (page 3265)

+ [defaultDepthLimit](#) (page 3229)

**Declared In**

NSWindow.h

**setExcludedFromWindowsMenu:**

Specifies whether the window's title is omitted from the application's Windows menu.

- (void)setExcludedFromWindowsMenu:(BOOL)*excludedFromWindowsMenu*

**Parameters**

*excludedFromWindowsMenu*

YES to specify that the window is to be omitted from the application's Windows menu; NO to specify otherwise.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [isExcludedFromWindowsMenu](#) (page 3271)

**Related Sample Code**

VertexPerformanceTest

**Declared In**

NSWindow.h

**setFrame:display:**

Sets the origin and size of the window's frame rectangle according to a given frame rectangle, thereby setting its position and size onscreen.

- (void)setFrame:(NSRect)*windowFrame* display:(BOOL)*displayViews*

**Parameters**

*windowFrame*

The frame rectangle for the window.

*displayViews*

Specifies whether the window redraws the views that need to be displayed. When YES the window sends a [displayIfNeeded](#) (page 3256) message down its view hierarchy, thus redrawing all views.

**Discussion**

Note that the window server limits window position coordinates to  $\pm 16,000$  and sizes to 10,000.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [frame](#) (page 3262)
- [setFrameFromString:](#) (page 3313)

NSWindow.h

**setFrame:display:animate:**

Sets the origin and size of the window's frame rectangle, with optional animation, according to a given frame rectangle, thereby setting its position and size onscreen.

```
- (void)setFrame:(NSRect>windowFrame display:(BOOL)displayViews
 animate:(BOOL)performAnimation
```

**Parameters***windowFrame*

The frame rectangle for the window.

*displayViews*

Specifies whether the window redraws the views that need to be displayed. When YES the window sends a [displayIfNeeded](#) (page 3256) message down its view hierarchy, thus redrawing all views.

*performAnimation*

Specifies whether the window performs a smooth resize. YES to perform the animation, whose duration is specified by [animationResizeTime](#): (page 3234).

**Availability**

Available in Mac OS X v10.0 and later.

**Related Sample Code**

iSpend

QTQuartzPlayer

**Declared In**

NSWindow.h

**setFrameAutosaveName:**

Sets the name used to automatically save the window's frame rectangle in the defaults system to a given name.

```
- (BOOL)setFrameAutosaveName:(NSString *)frameName
```

**Parameters***frameName*

The name under which the frame is to be saved.

**Return Value**

YES when the frame name is set successfully; NO when frameName is being used as an autosave name by another NSWindow object in the application (in which case the window's old name remains in effect).

**Discussion**

If *frameName* isn't the empty string (@" "), the window's frame is saved as a user default (as described in [saveFrameUsingName:](#) (page 3294)) each time the frame changes.

When the window has an autosave name, its frame data is written whenever the frame rectangle changes.

If there is a frame rectangle previously stored for *frameName* in the user defaults, the window's frame is set to this frame rectangle. That is, when you call this method with a previously used *frameName*, the window picks up the previously saved setting. For example, if you call `setFrameAutosaveName:` for a window that is already onscreen, this method could cause the window to move to a different screen location. For this reason, it is generally better to call this method before the window is visible on screen.

Keep in mind that a window controller may change the window's position when it displays it if window cascading is turned on. To preclude the window controller from changing a window's position from the one saved in the defaults system, you must send `setShouldCascadeWindows:NO` to the window controller.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- + [removeFrameUsingName:](#) (page 3231)
- [stringWithSavedFrame](#) (page 3330)
- [setFrameFromString:](#) (page 3313)

**Declared In**

NSWindow.h

**setFrameFromString:**

Sets the window's frame rectangle from a given string representation.

```
- (void)setFrameFromString:(NSString *)frameString
```

**Parameters**

*frameString*

A string representation of a frame rectangle, previously creating using [stringWithSavedFrame](#) (page 3330).

**Discussion**

The frame is constrained according to the window's minimum and maximum size settings. This method causes a [windowWillResize:toSize:](#) (page 3347) message to be sent to the delegate.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindow.h

**setFrameOrigin:**

Positions the bottom-left corner of the window's frame rectangle at a given point in screen coordinates.

```
- (void)setFrameOrigin:(NSPoint)point
```

**Parameters***point*

The new position of the window's bottom-left corner in screen coordinates.

**Discussion**

Note that the window server limits window position coordinates to  $\pm 16,000$ .

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setFrame:display:](#) (page 3311)
- [setFrameTopLeftPoint:](#) (page 3314)

**Related Sample Code**

FunkyOverlayWindow

**Declared In**

NSWindow.h

**setFrameTopLeftPoint:**

Positions the top-left corner of the window's frame rectangle at a given point in screen coordinates.

- (void)setFrameTopLeftPoint:(NSPoint)*point*

**Parameters***point*

The new position of the window's top-left corner in screen coordinates.

**Discussion**

Note that the window server limits window position coordinates to  $\pm 16,000$ ; if necessary, adjust *aPoint* relative to the window's lower-left corner to account for this limit.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

NSWindow.h

## setFrameUsingName:

Sets the window's frame rectangle by reading the rectangle data stored under a given name from the defaults system.

```
- (BOOL)setFrameUsingName:(NSString *)frameName
```

### Parameters

*frameName*

The name of the frame to read.

### Return Value

YES when *frameName* is read and the frame is set successfully; NO otherwise.

### Discussion

The frame is constrained according to the window's minimum and maximum size settings. This method causes a [windowWillResize:toSize:](#) (page 3347) message to be sent to the delegate.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [setFrameAutosaveName:](#) (page 3312)
- + [removeFrameUsingName:](#) (page 3231)
- [stringWithSavedFrame](#) (page 3330)
- [setFrameFromString:](#) (page 3313)

### Declared In

NSWindow.h

## setFrameUsingName:force:

Sets the window's frame rectangle by reading the rectangle data stored under a given name from the defaults system. Can operate on nonresizable windows.

```
- (BOOL)setFrameUsingName:(NSString *)frameName force:(BOOL) force
```

### Parameters

*frameName*

The name of the frame to read.

*force*

YES to use [setFrameUsingName:](#) (page 3315) on a nonresizable window; NO to fail on a nonresizable window.

### Return Value

YES when *frameName* is read and the frame is set successfully; NO otherwise.

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

NSWindow.h

## setHasShadow:

Specifies whether the window has a shadow.

- (void)setHasShadow:(BOOL)*hasShadow*

### Parameters

*hasShadow*

YES specifies that the window has a shadow; NO specifies otherwise.

### Discussion

If the shadow setting changes, the window shadow is invalidated, forcing the window shadow to be recomputed.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [hasShadow](#) (page 3265)
- [invalidateShadow](#) (page 3269)

### Related Sample Code

FunkyOverlayWindow  
JavaSplashScreen  
RoundTransparentWindow

### Declared In

NSWindow.h

## setHidesOnDeactivate:

Specifies whether the window is removed from the screen when the application is inactive.

- (void)setHidesOnDeactivate:(BOOL)*hideOnDeactivate*

### Parameters

*hideOnDeactivate*

- YES specifies that the window is to be hidden (taken out of the screen list) when the application stops being the active application
- NO specifies that the window is to remain onscreen when the application becomes inactive.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [hidesOnDeactivate](#) (page 3265)

### Declared In

NSWindow.h

## setIgnoresMouseEvents:

Specifies whether the window is transparent to mouse clicks and other mouse events, allowing overlay windows.

```
- (void)setIgnoresMouseEvents:(BOOL)ignoreMouseEvents
```

### Parameters

*ignoreMouseEvents*

YES to have the window ignore mouse events; NO to specify otherwise.

### Availability

Available in Mac OS X v10.2 and later.

### See Also

- [ignoresMouseEvents](#) (page 3266)

### Related Sample Code

FunkyOverlayWindow

### Declared In

NSWindow.h

## setInitialFirstResponder:

Sets a given view as the one that's made first responder (also called the key view) the first time the window is placed onscreen.

```
- (void)setInitialFirstResponder:(NSView *)view
```

### Parameters

*view*

The view to make first responder the first time the window is placed onscreen.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [initialFirstResponder](#) (page 3266)

### Declared In

NSWindow.h

## setLevel:

Sets the window's window level to a given level.

```
- (void)setLevel:(NSInteger>windowLevel
```

### Parameters

*windowLevel*

The window level to set.

**Discussion**

Some useful predefined values, ordered from lowest to highest, are described in “[Constants](#)” (page 3350).

Each level in the list groups windows within it in front of those in all preceding groups. Floating windows, for example, appear in front of all normal-level windows. When a window enters a new level, it’s ordered in front of all its peers in that level.

The constant `NSTornOffMenuWindowLevel` is preferable to its synonym, `NSSubmenuWindowLevel`.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [level](#) (page 3276)
- [orderWindow:relativeTo:](#) (page 3285)
- [orderFront:](#) (page 3283)
- [orderBack:](#) (page 3283)

**Related Sample Code**

FunkyOverlayWindow  
 JavaSplashScreen  
 RoundTransparentWindow  
 UIElementInspector

**Declared In**

NSWindow.h

**setMaxSize:**

Sets the maximum size to which the window’s frame (including its title bar) can be sized.

```
- (void)setMaxSize:(NSSize)maxFrameSize
```

**Parameters**

*maxFrameSize*

The maximum size of the window’s frame.

**Discussion**

The maximum size constraint is enforced for resizing by the user as well as for the `setFrame...` methods other than [setFrame:display:](#) (page 3311). Note that the window server limits window sizes to 10,000.

The default maximum size of a window is `{FLT_MAX, FLT_MAX}` (`FLT_MAX` is defined in `/usr/include/float.h`). Once the maximum size of a window has been set, there is no way to reset it other than specifying this default maximum size.

The [setContentMaxSize:](#) (page 3305) method takes precedence over this method.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [maxSize](#) (page 3279)
- [setMinSize:](#) (page 3320)

- [setAspectRatio:](#) (page 3299)
- [setResizeIncrements:](#) (page 3325)

**Declared In**

NSWindow.h

**setMiniwindowImage:**

Sets the window's custom minimized window image to a given image.

```
- (void)setMiniwindowImage:(NSImage *)miniwindowImage
```

**Parameters***miniwindowImage*

Image to set as the window's minimized window image.

**Discussion**

When the user minimizes the window, the Dock displays *miniwindowImage* in the corresponding Dock tile, scaling it as needed to fit in the tile. If you do not specify a custom image using this method, the Dock creates one for you automatically.

You can also call this method as needed to change the minimized window image. Typically, you would specify a custom image immediately prior to a window being minimized—when the system posts an [NSWindowWillMiniaturizeNotification](#) (page 3364). You can call this method while the window is minimized to update the current image in the Dock. However, this method is not recommended for creating complex animations in the Dock.

Support for custom images is disabled by default. To enable support, set the `AppleDockIconEnabled` key to YES when first registering your application's user defaults. You must set this key prior to calling the `init` method of `NSApplication`, which reads the current value of the key.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [miniwindowImage](#) (page 3280)
- [isMiniaturized](#) (page 3272)

**Declared In**

NSWindow.h

**setMiniwindowTitle:**

Sets the title of the window's miniaturized counterpart to a given string and redisplay it.

```
- (void)setMiniwindowTitle:(NSString *)miniwindowTitle
```

**Parameters***miniwindowTitle*

The string to set as the title of the minimized window.

**Discussion**

A minimized window's title normally reflects that of its full-size counterpart, abbreviated to fit if necessary. Although this method allows you to set the minimized window's title explicitly, changing the full-size `NSWindow` object's title (through `setTitle:` (page 3326) or `setTitleWithRepresentedFilename:` (page 3327)) automatically changes the minimized window's title as well.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [miniwindowTitle](#) (page 3280)

**Declared In**

`NSWindow.h`

**setSize:**

Sets the minimum size to which the window's frame (including its title bar) can be sized to *aSize*.

– (void)setMinSize:(NSSize)*minFrameSize*

**Parameters**

*minFrameSize*

The minimum size of the window's frame.

**Discussion**

The minimum size constraint is enforced for resizing by the user as well as for the `setFrame:...` methods other than `setFrame:display:` (page 3311).

The `setContentMinSize:` (page 3305) method takes precedence over this method.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [minSize](#) (page 3280)
- [setMaxSize:](#) (page 3318)
- [setAspectRatio:](#) (page 3299)
- [setResizeIncrements:](#) (page 3325)

**Declared In**

`NSWindow.h`

**setMovableByWindowBackground:**

Sets whether the window is movable by clicking and dragging anywhere in its background.

– (void)setMovableByWindowBackground:(BOOL)*movableByWindowBackground*

**Parameters***movableByWindowBackground*

YES to specify that the window is movable by background, NO to specify that the window is not movable by background.

**Availability**

Available in Mac OS X v10.2 and later.

**See Also**

– [isMovableByWindowBackground](#) (page 3272)

**Declared In**

NSWindow.h

**setOneShot:**

Sets whether the window device that the window manages should be freed when it's removed from the screen list.

– (void)setOneShot:(BOOL)oneShot

**Parameters***oneShot*

YES to free the window's window device when it's removed from the screen list (hidden) and to create another one when it's returned to the screen; NO to reuse the window device.

**Discussion**

Freeing the window device when it's removed from the screen list can result in memory savings and performance improvement for NSWindow objects that don't take long to display. It's particularly appropriate for NSWindow objects the user might use once or twice but not display continually.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [isOneShot](#) (page 3273)

**Related Sample Code**

VideoViewer

**Declared In**

NSWindow.h

**setOpaque:**

Specifies whether the window is opaque.

– (void)setOpaque:(BOOL)opaque

**Parameters***opaque*

YES specifies that the window is opaque; NO specifies otherwise.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [isOpaque](#) (page 3273)

**Declared In**

NSWindow.h

**setParentWindow:**

Adds the window as a child of a given window. For use by subclasses when setting the parent window in the window.

– (void)setParentWindow:(NSWindow \*)*parentWindow*

**Parameters**

*parentWindow*

The window to be a child of the given window.

**Discussion**

You should call super if overriding.

**Availability**

Available in Mac OS X v10.2 and later.

**See Also**

- [removeChildWindow:](#) (page 3290)
- [childWindows](#) (page 3243)
- [parentWindow](#) (page 3285)
- [addChildWindow:ordered:](#) (page 3233)

**Declared In**

NSWindow.h

**setPreferredBackingLocation:**

Specifies the preferred location for the window's backing store.

– (void)setPreferredBackingLocation:(NSWindowBackingLocation)*preferredBackingLocation*

**Parameters**

*preferredBackingLocation*

The preferred location for the window's backing store. See “[Constants](#)” (page 3350) for possible values.

**Discussion**

Use only when optimizing for performance.

**Availability**

Available in Mac OS X v10.5 and later.

**See Also**

– [preferredBackingLocation](#) (page 3288)

**Declared In**

NSWindow.h

**setPreservesContentDuringLiveResize:**

Specifies whether the window tries to optimize live resize operations by preserving the content of views that have not changed.

– (void)setPreservesContentDuringLiveResize:(BOOL)preservesContentDuringLiveResize

**Parameters**

*preservesContentDuringLiveResize*

YES turns on live-resize optimization; NO turns it off for the window and all of its contained views.

**Discussion**

By default, live-resize optimization is turned on.

You might consider disabling this optimization for the window if none of the window's contained views can take advantage of it. Disabling the optimization for the window prevents it from checking each view to see if the optimization is supported.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

– [preservesContentDuringLiveResize](#) (page 3288)

**Declared In**

NSWindow.h

**setReleasedWhenClosed:**

Specifies whether the window is released when it receives the `close` message.

– (void)setReleasedWhenClosed:(BOOL)releasedWhenClosed

**Parameters**

*releasedWhenClosed*

YES to specify that the window is to be hidden and released when it receives a close message; NO to specify that the window is only hidden, not released.

**Discussion**

Another strategy for releasing an `NSWindow` object is to have its delegate autorelease it on receiving a [windowShouldClose:](#) (page 3345) message.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [close](#) (page 3243)

**setRepresentedURL:**

Specifies the URL of the file the window represents.

```
- (void)setRepresentedURL:(NSURL *)representedURL
```

**Parameters**

*representedURL*

The URL of the file the window is to represent.

**Availability**

Available in Mac OS X v10.5 and later.

**See Also**

- [representedURL](#) (page 3291)

**Declared In**

NSWindow.h

## setResizeIncrements:

Restricts the user's ability to resize the window so the width and height change by multiples of width and height increments.

- (void)setResizeIncrements:(NSSize)*resizeIncrements*

### Parameters

*resizeIncrements*

The resizing increments to set.

### Discussion

As the user resizes the window, its size changes by multiples of *increments.width* and *increments.height*, which should be whole numbers, 1.0 or greater. Whatever the current resizing increments, you can set an `NSWindow` object's size to any height and width programmatically.

Resize increments and aspect ratio are mutually exclusive attributes. For more information, see [setAspectRatio:](#) (page 3299).

The [setContentResizeIncrements:](#) (page 3306) method takes precedence over this method.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [resizeIncrements](#) (page 3293)

### Declared In

`NSWindow.h`

## setSharingType:

Specifies the level of access other processes have to the window's content.

- (void)setSharingType:(NSWindowSharingType)*sharingType*

### Parameters

*sharingType*

The sharing level of the window's content. See ["Constants"](#) (page 3350) for possible values.

### Availability

Available in Mac OS X v10.5 and later.

### See Also

- [sharingType](#) (page 3329)

### Declared In

`NSWindow.h`

## setShowsResizeIndicator:

Specifies whether the window's resize indicator is visible

- (void)setShowsResizeIndicator:(BOOL)*showResizeIndicator*

**Parameters**

*showResizeIndicator*

Specifies the resize indicator state. YES to show it, NO to hide it.

**Discussion**

This method does not affect whether the window is resizable.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [showsResizeIndicator](#) (page 3329)

**Declared In**

NSWindow.h

**setShowsToolbarButton:**

Specifies whether the window shows the toolbar control button.

- (void)setShowsToolbarButton:(BOOL)*showsToolbarButton*

**Parameters**

*showsToolbarButton*

YES to display the toolbar control button; NO to hide the button.

**Discussion**

If the window does not have a toolbar, this method has no effect.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [showsToolbarButton](#) (page 3329)

**Declared In**

NSWindow.h

**setTitle:**

Sets the string that appears in the window's title bar (if it has one) to a given string and displays the title.

- (void)setTitle:(NSString \*)*title*

**Parameters**

*title*

The string to set as the window's title.

**Discussion**

Also sets the title of the window's miniaturized window.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [title](#) (page 3331)
- [setTitleWithRepresentedFilename:](#) (page 3327)
- [setMiniwindowTitle:](#) (page 3319)

VertexPerformanceTest

WhackedTV

**Declared In**

NSWindow.h

**setTitleWithRepresentedFilename:**

Sets a given path as the window's title, formatting it as a file-system path, and records this path as the window's associated filename using [setRepresentedFilename:](#) (page 3324).

```
- (void)setTitleWithRepresentedFilename:(NSString *)filePath
```

**Parameters**

*filePath*

The file path to set as the window's title.

**Discussion**

The filename—not the pathname—is displayed in the window's title bar.

This method also sets the title bar of the window's minimized window.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [title](#) (page 3331)
- [setTitle:](#) (page 3326)
- [setMiniwindowTitle:](#) (page 3319)

**Declared In**

NSWindow.h

## sharingType

Indicates the level of access other processes have to the window's content.

- (NSWindowSharingType)sharingType

**Return Value**

The sharing level of the window's content. See “[Constants](#)” (page 3350) for possible values.

**Availability**

Available in Mac OS X v10.5 and later.

**See Also**

- [setSharingType:](#) (page 3325)

**Declared In**

NSWindow.h

## showsResizeIndicator

Returns a Boolean value that indicates whether the window's resize indicator is visible.

- (BOOL)showsResizeIndicator

**Return Value**

YES when the window's resize indicator is visible, otherwise NO.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setShowsResizeIndicator:](#) (page 3325)

**Declared In**

NSWindow.h

## showsToolbarButton

Indicates whether the toolbar control button is currently displayed.

- (BOOL)showsToolbarButton

**Return Value**

YES if the standard toolbar button is currently displayed; NO otherwise.

**Discussion**

When clicked, the toolbar control button shows or hides a window's toolbar. The toolbar control button appears in a window's title bar.

**Availability**

Available in Mac OS X v10.4 and later.

**See Also**

- [setShowsToolbarButton:](#) (page 3326)

**Declared In**

NSWindow.h

**standardWindowButton:**

Returns the window button of a given window button kind in the window's view hierarchy.

```
- (NSButton *)standardWindowButton:(NSWindowButton)windowButtonKind
```

**Parameters**

*windowButtonKind*

The kind of standard window button to return.

**Return Value**

Window button in the window's view hierarchy of the kind identified by *windowButtonKind*; nil when such button is not in the window's view hierarchy.

**Availability**

Available in Mac OS X v10.2 and later.

**See Also**

+ [standardWindowButton:forStyleMask:](#) (page 3231)

**Declared In**

NSWindow.h

**stringWithSavedFrame**

Returns a string representation of the window's frame rectangle.

```
- (NSString *)stringWithSavedFrame
```

**Return Value**

A string representation of the window's frame rectangle in a format that can be used with a later [setFrameFromString:](#) (page 3313) message.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindow.h

## styleMask

Returns the window's style mask, indicating what kinds of control items it displays.

- (NSUInteger)styleMask

### Return Value

The window's style mask.

### Discussion

See the information about the style mask in [“Constants”](#) (page 3350). A window's style is set when the object is initialized. Once set, it can't be changed.

### Availability

Available in Mac OS X v10.0 and later.

UIElementInspector

### Declared In

NSWindow.h

## toggleToolbarShown:

The action method for the “Hide Toolbar” menu item (which alternates with “Show Toolbar”).

- (void)toggleToolbarShown:(id)sender

**Parameters**

*sender*

The message's sender.

**Discussion**

See the `NSToolbar` class description for additional information.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSWindow.h`

## toolbar

Returns the window's toolbar.

- (NSToolbar \*)toolbar

**Return Value**

The window's toolbar.

**Discussion**

See the `NSToolbar` class description for additional information.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setToolbar:](#) (page 3327)

**Declared In**

`NSWindow.h`

## tryToPerform:with:

Dispatches action messages with a given argument.

- (BOOL)tryToPerform:(SEL)selector with:(id)object

**Parameters**

*selector*

The selector to attempt to execute.

*object*

The message's argument.

**Return Value**

*YES* when the window or its delegate perform *selector* with *object*; *NO* otherwise.

**Discussion**

The window tries to perform the method *selector* using its inherited `NSResponder` method `tryPerformWith:` (page 2163). If the window doesn't perform *selector*, the delegate is given the opportunity to perform it using its inherited `NSObject` method `performSelector:withObject:`.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSWindow.h`

## **unregisterDraggedTypes**

Unregisters the window as a possible destination for dragging operations.

- (void)unregisterDraggedTypes

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [registerForDraggedTypes:](#) (page 3290)

**Declared In**

`NSWindow.h`

## **update**

Updates the window.

- (void)update

**Discussion**

The `NSWindow` implementation of this method does nothing more than post an `NSWindowDidUpdateNotification` (page 3364) notification to the default notification center. A subclass can override this method to perform specialized operations, but it should send an update message to `super` just before returning. For example, the `NSMenu` class implements this method to disable and enable menu commands.

An `NSWindow` object is automatically sent an update message on every pass through the event loop and before it's displayed onscreen. You can manually cause an update message to be sent to all visible `NSWindow` objects through the `NSApplication` `updateWindows` (page 178) method.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setWindowsNeedUpdate:](#) (page 171) (`NSApplication`)

**Declared In**

`NSWindow.h`

## useOptimizedDrawing:

Specifies whether the window is to optimize focusing and drawing when displaying its views.

- (void)useOptimizedDrawing:(BOOL)*optimizedDrawing*

### Parameters

*optimizedDrawing*

YES to have the window optimize focusing and drawing for its views; NO to specify otherwise, in which case, the window does not preserve the Z-ordering of overlapping views when an object explicitly sends [lockFocus](#) (page 3135) to a view and draws directly to it, instead of using the AppKit standard display mechanism.

### Discussion

The optimizations may prevent sibling subviews from being displayed in the correct order—which matters only if the subviews overlap. You should always set *optimizedDrawing* to YES when there are no overlapping subviews within the window. The default is NO.

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

NSWindow.h

## userSpaceScaleFactor

Returns the scale factor applied to the window.

- (CGFloat)userSpaceScaleFactor

### Return Value

The scale factor applied to the window.

### Discussion

Clients can multiply view coordinates by the returned scale factor to get a set of new coordinates that are scaled to the resolution of the target screen. For example, if the scale factor is 1.25 and the view frame size is 80 x 80, the actual size of the view frame is 100 x 100 pixels on the target screen.

### Availability

Available in Mac OS X v10.4 and later.

### Declared In

NSWindow.h

## validRequestorForSendType:returnType:

Searches for an object that responds to a Services request.

- (id)validRequestorForSendType:(NSString \*)*sendType* returnType:(NSString \*)*returnType*

### Parameters

*sendType*

The input type of the Services request.

*returnType*

The return type of the Services request.

### Return Value

The object that responds to the services request; `nil` when none is found.

### Discussion

Messages to perform this method are initiated by the Services menu. It's part of the mechanism that passes `validRequestorForSendType:returnType:` messages up the responder chain.

This method works by forwarding the message to the window's delegate if it responds (and provided it isn't an `NSResponder` object with its own next responder). If the delegate doesn't respond to the message or returns `nil` when sent it, this method forwards the message to the `NSApplication` object. If the `NSApplication` object returns `nil`, this method also returns `nil`. Otherwise this method returns the object returned by the delegate or the `NSApplication` object.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [validRequestorForSendType:returnType:](#) (page 2164) (`NSResponder`)
- [validRequestorForSendType:returnType:](#) (page 179) (`NSApplication`)

### Declared In

`NSWindow.h`

## viewsNeedDisplay

Indicates whether any of the window's views need to be displayed.

- (BOOL)viewsNeedDisplay

### Return Value

YES when any of the window's views need to be displayed; NO otherwise.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [setViewsNeedDisplay:](#) (page 3328)

### Declared In

`NSWindow.h`

## windowController

Returns the window's window controller.

- (id>windowController

### Return Value

The window's window controller.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setWindowController:](#) (page 3328)

**Related Sample Code**

Sketch-112

**Declared In**

NSWindow.h

## windowNumber

Provides the window number of the window's window device.

- (NSInteger)windowNumber

**Return Value**

The window number of the window's window device.

**Discussion**

Each window device in an application is given a unique window number—note that this isn't the same as the global window number assigned by the window server. This number can be used to identify the window device with the [orderWindow:relativeTo:](#) (page 3285) method and in the Application Kit function [NSWindowList](#) (page 3699).

If the window doesn't have a window device, the value returned will be equal to or less than 0.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [initWithContentRect:styleMask:backing:defer:](#) (page 3266)

- [setOneShot:](#) (page 3321)

**Related Sample Code**

CocoaDVDPlayer

Quartz Composer WWDC 2005 TextEdit

TextEditPlus

**Declared In**

NSWindow.h

## windowRef

Returns the Carbon `WindowRef` associated with the window, creating one if necessary.

- (void \*)windowRef

**Discussion**

This method can be used to create a `WindowRef` for a window containing a Carbon control. Subsequent calls to this method return the existing `WindowRef`. You use a `WindowRef` to create a Carbon window reference for a Cocoa window; this assists the integration of Carbon and Cocoa code and objects.

For more information see `MacWindows.h`. For more information on Carbon-Cocoa integration, see *Carbon-Cocoa Integration Guide*.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [initWithWindowRef:](#) (page 3268)

**Declared In**

`NSWindow.h`

## worksWhenModal

Indicates whether the window is able to receive keyboard and mouse events even when some other window is being run modally.

- (BOOL)worksWhenModal

**Return Value**

YES if the window is able to receive keyboard and mouse events even when some other window is being run modally; NO otherwise.

**Discussion**

The `NSWindow` implementation of this method returns NO. Only subclasses of `NSPanel` should override this default.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setWorksWhenModal:](#) (page 1858) (`NSPanel`)

**Declared In**

`NSWindow.h`

## zoom:

This action method toggles the size and location of the window between its standard state (provided by the application as the “best” size to display the window’s data) and its user state (a new size and location the user may have set by moving or resizing the window).

- (void)zoom:(id)sender

**Parameters**

*sender*

The object sending the message.

**Discussion**

For more information on the standard and user states, see

[windowWillUseStandardFrame:defaultFrame:](#) (page 3349).

The `zoom:` method is typically invoked after a user clicks the window's zoom box but may also be invoked programmatically from the [performZoom:](#) (page 3287) method. It performs the following steps:

1. Invokes the [windowWillUseStandardFrame:defaultFrame:](#) (page 3349) method, if the delegate or the window class implements it, to obtain a “best fit” frame for the window. If neither the delegate nor the window class implements the method, uses a default frame that nearly fills the current screen, which is defined to be the screen containing the largest part of the window's current frame.
2. Adjusts the resulting frame, if necessary, to fit on the current screen.
3. Compares the resulting frame to the current frame to determine whether the window's standard frame is currently displayed. If the current frame is within a few pixels of the standard frame in size and location, it is considered a match.
4. Determines a new frame. If the window is currently in the standard state, the new frame represents the user state, saved during a previous zoom. If the window is currently in the user state, the new frame represents the standard state, computed in step 1 above. If there is no saved user state because there has been no previous zoom, the size and location of the window do not change.
5. Determines whether the window currently allows zooming. By default, zooming is allowed. If the window's delegate implements the [windowShouldZoom:toFrame:](#) (page 3346) method, `zoom:` invokes that method. If the delegate doesn't implement the method but the window does, `zoom:` invokes the window's version. `windowShouldZoom:toFrame:` returns `NO` if zooming is not currently allowed.
6. If the window currently allows zooming, sets the new frame.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [isZoomed](#) (page 3275)

**Declared In**

`NSWindow.h`

## Delegate Methods

### **`window:shouldDragDocumentWithEvent:from:withPasteboard:`**

Determines whether the sender allows the user to drag the sender's represented file's icon from the sender's title bar.

```
– (BOOL)window:(NSWindow *)sender shouldDragDocumentWithEvent:(NSEvent *)mouseEvent
 from:(NSPoint)startPoint withPasteboard:(NSPasteboard *)pasteboard
```

**Parameters***sender*

The window whose represented file's icon the user wants to drag.

*mouseEvent*

The left-mouse down event that triggered the dragging operation.

*startPoint*

The location at which the user started the dragging operation.

*pasteboard*

The pasteboard containing the contents of the represented file, which the delegate can modify.

**Return Value**

YES to allow the drag to proceed, NO to prevent it.

**Discussion**

To implement its own dragging process, the delegate can perform the dragging operation and return NO.

**Availability**

Available in Mac OS X v10.5 and later.

**See Also**

- [representedURL](#) (page 3291)

**Declared In**

NSWindow.h

**window:shouldPopUpDocumentPathMenu:**

Determines whether the sender displays the title pop-up menu in response to a Command-click on the sender's title.

```
-(BOOL)window:(NSWindow *)sender shouldPopUpDocumentPathMenu:(NSMenu *)titleMenu
```

**Parameters***sender*

The window whose title the user Command-clicked.

*titleMenu*

The menu the sender displays, if allowed. By default its items are the path components of the file represented by *sender*.

**Return Value**

YES to allow the display of the title pop-up menu, NO to prevent it.

**Availability**

Available in Mac OS X v10.5 and later.

**See Also**

- [representedURL](#) (page 3291)

**Declared In**

NSWindow.h

**window:willPositionSheet:usingRect:**

Sent to the delegate just before the animation of a sheet, giving it the opportunity to return a custom location for the attachment of a sheet to a window.

```
- (NSRect)window:(NSWindow *)window willPositionSheet:(NSWindow *)sheet
 usingRect:(NSRect)defaultSheetRect
```

**Parameters**

*window*

The window containing the sheet to be animated.

*sheet*

The sheet to be animated.

*defaultSheetRect*

The default sheet location, just under the title bar of the window, aligned with the left and right edges of the window.

**Return Value**

A custom location for the attachment of *sheet* to *window*.

**Discussion**

This method is also invoked whenever the user resizes *window* while *sheet* is attached.

This method is useful in many situations. If your window has a toolbar, for example, you can specify a location for the sheet that is just below it. If you want the sheet associated with a certain control or view, you could position the sheet so that it appears to originate from the object (through animation) or is positioned next to it.

Neither the *defaultSheetRect* parameter nor the returned `NSRect` value define the boundary of the sheet. They indicate where the top-left edge of the sheet is attached to the window. The origin is expressed in window coordinates; the default `origin.y` value is the height of the content view and the default `origin.x` value is zero. The `size.width` value indicates the width and behavior of the initial animation; if `size.width` is narrower than the sheet, the sheet genies out from the specified location, and if `size.width` is wider than the sheet, the sheet slides out. You cannot affect the size of the sheet through the `size.width` and `size.height` fields. It is recommended that you specify zero for the `size.height` value as this field may have additional meaning in a future release.

**Availability**

Available in Mac OS X v10.3 and later.

**Declared In**

`NSWindow.h`

**windowDidBecomeKey:**

Sent by the default notification center immediately after an `NSWindow` object has become key.

```
- (void>windowDidBecomeKey:(NSNotification *)notification
```

**Parameters**

*notification*

[NSWindowDidBecomeKeyNotification](#) (page 3360).

**Discussion**

You can retrieve the `NSWindow` object in question by sending `object` to *notification*.

**Availability**

Available in Mac OS X v10.0 and later.

`NSWindow.h`

**windowDidChangeScreenProfile:**

Sent by the default notification center immediately after an `NSWindow` object has changed screen display profiles.

```
- (void)windowDidChangeScreenProfile:(NSNotification *)notification
```

**Parameters***notification*[NSNotificationDidChangeScreenProfileNotification](#) (page 3361).**Discussion**

You can retrieve the `NSWindow` object in question by sending object to *notification*.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

`NSWindow.h`

**windowDidDeminiaturize:**

Sent by the default notification center immediately after an `NSWindow` object has been deminimized.

- (void)windowDidDeminiaturize:(NSNotification \*)*notification*

**Parameters***notification*[NSNotificationDidDeminiaturizeNotification](#) (page 3362).**Discussion**

You can retrieve the `NSWindow` object in question by sending object to *notification*.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSWindow.h`

**windowDidEndSheet:**

Sent by the default notification center immediately after an `NSWindow` object closes a sheet.

- (void)windowDidEndSheet:(NSNotification \*)*notification*

**Parameters***notification*[NSNotificationDidEndSheetNotification](#) (page 3362).**Discussion**

You can retrieve the `NSWindow` object in question by sending object to *notification*.

**Availability**

Available in Mac OS X v10.1 and later.

**Declared In**

`NSWindow.h`

## windowDidExpose:

Sent by the default notification center immediately after an `NSWindow` object has been exposed.

- (void)windowDidExpose:(NSNotification \*)*notification*

### Parameters

*notification*

[NSNotificationDidExposeNotification](#) (page 3362).

### Discussion

You can retrieve the `NSWindow` object in question by sending object to *notification*.

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

`NSWindow.h`

## windowDidMiniaturize:

Sent by the default notification center immediately after an `NSWindow` object has been minimized.

- (void)windowDidMiniaturize:(NSNotification \*)*notification*

### Parameters

*notification*

[NSNotificationDidMiniaturizeNotification](#) (page 3362).

### Discussion

You can retrieve the `NSWindow` object in question by sending object to *notification*.

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

`NSWindow.h`

## windowDidMove:

Sent by the default notification center immediately after an `NSWindow` object has been moved.

- (void)windowDidMove:(NSNotification \*)*notification*

### Parameters

*notification*

[NSNotificationDidMoveNotification](#) (page 3363).

### Discussion

You can retrieve the `NSWindow` object in question by sending object to *notification*.

### Availability

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindow.h

**windowDidResignKey:**

Sent by the default notification center immediately after an `NSWindow` object has resigned its status as key window.

- (void)windowDidResignKey:(NSNotification \*)*notification*

**Parameters***notification*[NSWindowDidResignKeyNotification](#) (page 3363).**Discussion**

You can retrieve the `NSWindow` object in question by sending object to *notification*.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindow.h

**windowDidResignMain:**

Sent by the default notification center immediately after an `NSWindow` object has resigned its status as main window.

- (void)windowDidResignMain:(NSNotification \*)*notification*

**Parameters***notification*[NSWindowDidResignMainNotification](#) (page 3363).**Discussion**

You can retrieve the `NSWindow` object in question by sending object to *notification*.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindow.h

**windowDidResize:**

Sent by the default notification center immediately after a window has been resized.

- (void)windowDidResize:(NSNotification \*)*notification*

**Parameters***notification*[NSWindowDidResizeNotification](#) (page 3363).

**Discussion**

You can retrieve the `NSWindow` object in question by sending `object` to *notification*.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSWindow.h`

**windowDidUpdate:**

Sent by the default notification center immediately after an `NSWindow` object receives an [update](#) (page 3333) message.

- (void)`windowDidUpdate:(NSNotification *)notification`

**Parameters**

*notification*

[NSWindowDidUpdateNotification](#) (page 3364).

**Discussion**

You can retrieve the `NSWindow` object in question by sending `object` to *notification*.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSWindow.h`

**windowShouldClose:**

Invoked when the user attempts to close a window or a window receives a [performClose:](#) (page 3286) message.

- (BOOL)`windowShouldClose:(id)window`

**Parameters**

*window*

The window being closed.

**Return Value**

YES to allow *window* to be closed, otherwise NO.

**Discussion**

This method may not always be called during window closing. Specifically, this method is not called when a user quits an application. You can find additional information on application termination in [Graceful Application Termination](#).

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSWindow.h`

## windowShouldZoom:toFrame:

Sent just before *sender* is zoomed to allow or disallow the operation.

- (BOOL)windowShouldZoom:(NSWindow \*)*window* toFrame:(NSRect)*proposedFrame*

### Parameters

*window*

The window being zoomed.

*proposedFrame*

The rectangle to which *window* is being zoomed.

### Return Value

YES to allow the *window* frame to become *proposedFrame*; NO otherwise.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [windowWillUseStandardFrame:defaultFrame:](#) (page 3349)

### Declared In

NSWindow.h

## windowWillBeginSheet:

Sent by the default notification center immediately before an NSWindow object opens a sheet.

- (void)windowWillBeginSheet:(NSNotification \*)*notification*

### Parameters

*notification*

[NSWindowWillBeginSheetNotification](#) (page 3364).

### Discussion

You can retrieve the NSWindow object in question by sending object to *notification*.

### Availability

Available in Mac OS X v10.1 and later.

### Declared In

NSWindow.h

## windowWillClose:

Sent by the default notification center immediately before an NSWindow object closes.

- (void)windowWillClose:(NSNotification \*)*notification*

### Parameters

*notification*

[NSWindowWillCloseNotification](#) (page 3364).

**Discussion**

You can retrieve the `NSWindow` object in question by sending `object` to *notification*.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSWindow.h`

**windowWillMiniaturize:**

Sent by the default notification center immediately before an `NSWindow` object is minimized.

- (void)windowWillMiniaturize:(NSNotification \*)*notification*

**Parameters**

*notification*

[NSWindowWillMiniaturizeNotification](#) (page 3364).

**Discussion**

You can retrieve the `NSWindow` object in question by sending `object` to *notification*.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSWindow.h`

**windowWillMove:**

Sent by the default notification center immediately before an `NSWindow` object is moved.

- (void)windowWillMove:(NSNotification \*)*notification*

**Parameters**

*notification*

[NSWindowWillMoveNotification](#) (page 3365).

**Discussion**

You can retrieve the `NSWindow` object in question by sending `object` to *notification*.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSWindow.h`

**windowWillResize:toSize:**

Invoked when a window is being resized (whether by the user or through one of the `setFrame...` methods other than `setFrame:display:` (page 3311)).

- (NSSize)windowWillResize:(NSWindow \*)*window* toSize:(NSSize)*proposedFrameSize*

**Parameters***window*

The window being resized.

*proposedFrameSize*The size to which *window* is being resized.**Discussion**

The *proposedFrameSize* contains the size (in screen coordinates) the sender will be resized to. To resize to a different size, simply return the desired size from this method; to avoid resizing, return the current size. The `NSWindow` object's minimum and maximum size constraints have already been applied when this method is invoked.

While the user is resizing a window, the delegate is sent a series of `windowWillResize:toSize:` messages as the window's outline is dragged. The window's outline is displayed at the constrained size as set by this method.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**`NSWindow.h`**windowWillReturnFieldEditor:toObject:**

Invoked when the field editor for a text-displaying object is requested.

```
- (id)windowWillReturnFieldEditor:(NSWindow *)window toObject:(id)anObject
```

**Parameters***window*

The window that is requesting the field editor from the delegate.

*anObject*

A text-displaying object to be associated with the field editor. If `nil`, the requested field editor is the default.

**Return Value**

The field editor for *anObject*; returns `nil` when the delegate has no field editor to assign.

**Discussion**

This method may be called multiple times while a control is first responder. Therefore, you must return the same field editor object for the control while the control is being edited.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [fieldEditor:forObject:](#) (page 3260)

**Declared In**`NSWindow.h`

**windowWillReturnUndoManager:**

Invoked when the undo manager for a window is requested. Returns the appropriate undo manager for the window.

```
- (NSUndoManager *)windowWillReturnUndoManager:(NSWindow *)window
```

**Parameters**

*window*

The window whose undo manager is being requested.

**Return Value**

The appropriate undo manager for *window*.

**Discussion**

If this method is not implemented by the delegate, the `NSWindow` object creates an `NSUndoManager` object for *window*.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSWindow.h`

**windowWillUseStandardFrame:defaultFrame:**

Invoked by the [zoom:](#) (page 3337) method while determining a frame an `NSWindow` object may be zoomed to.

```
- (NSRect>windowWillUseStandardFrame:(NSWindow *)window
 defaultFrame:(NSRect)defaultFrame
```

**Parameters**

*window*

The window whose frame size is being determined.

*defaultFrame*

The size of the current screen, which is the screen containing the largest part of the window's current frame, possibly reduced on the top, bottom, left, or right, depending on the current interface style. The frame is reduced on the top to leave room for the menu bar.

**Return Value**

The standard frame for *window*.

**Discussion**

The standard frame for a window should supply the size and location that are “best” for the type of information shown in the window, taking into account the available display or displays. For example, the best width for a window that displays a word-processing document is the width of a page or the width of the display, whichever is smaller. The best height can be determined similarly. On return from this method, the [zoom:](#) (page 3337) method modifies the returned standard frame, if necessary, to fit on the current screen.

To customize the standard state, implement `windowWillUseStandardFrame:defaultFrame:` in the class of the window's delegate or, if necessary, in a window subclass. Your version should return a suitable standard frame, based on the currently displayed data or other factors.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [windowShouldZoom:toFrame:](#) (page 3346)

**Declared In**

NSWindow.h

## Constants

### Window Style Masks

These constants specify the presence of a title and various buttons in a window's border. It can be `NSBorderlessWindowMask`, or it can contain any of the following options, combined using the C bitwise OR operator:

```
enum {
 NSBorderlessWindowMask = 0,
 NSTitledWindowMask = 1 << 0,
 NSClosableWindowMask = 1 << 1,
 NSMiniaturizableWindowMask = 1 << 2,
 NSResizableWindowMask = 1 << 3,
 NSTexturedBackgroundWindowMask = 1 << 8
};
```

**Constants**

`NSBorderlessWindowMask`

The window displays none of the usual peripheral elements. Useful only for display or caching purposes.

Available in Mac OS X v10.0 and later.

Declared in `NSWindow.h`.

`NSTitledWindowMask`

The window displays a title bar.

Available in Mac OS X v10.0 and later.

Declared in `NSWindow.h`.

`NSClosableWindowMask`

The window displays a close button.

Available in Mac OS X v10.0 and later.

Declared in `NSWindow.h`.

`NSMiniaturizableWindowMask`

The window displays a minimize button.

Available in Mac OS X v10.0 and later.

Declared in `NSWindow.h`.

`NSResizableWindowMask`

The window displays a resize control.

Available in Mac OS X v10.0 and later.

Declared in `NSWindow.h`.

`NSTexturedBackgroundWindowMask`

The window displays with a metal-textured background. Additionally, the window may be moved by clicking and dragging anywhere in the window background. A bordered window with this mask gets rounded bottom corners.

Available in Mac OS X v10.2 and later.

Declared in `NSWindow.h`.

#### Declared In

`NSWindow.h`

## Window Levels

These constants specify the window's level. The stacking of levels takes precedence over the stacking of windows within each level. That is, even the bottom window in a level will obscure the top window of the next level down. Levels are listed in order from lowest to highest. These constants are mapped (using `#define` statements) to corresponding elements in the `Window Level Keys` in *Core Graphics*.

|                                               |                                        |
|-----------------------------------------------|----------------------------------------|
| <code>#define NSNormalWindowLevel</code>      | <code>kCGNormalWindowLevel</code>      |
| <code>#define NSFloatingWindowLevel</code>    | <code>kCGFloatingWindowLevel</code>    |
| <code>#define NSSubmenuWindowLevel</code>     | <code>kCGTornOffMenuWindowLevel</code> |
| <code>#define NSTornOffMenuWindowLevel</code> | <code>kCGTornOffMenuWindowLevel</code> |
| <code>#define NSMainMenuWindowLevel</code>    | <code>kCGMainMenuWindowLevel</code>    |
| <code>#define NSStatusWindowLevel</code>      | <code>kCGStatusWindowLevel</code>      |
| <code>#define NSModalPanelWindowLevel</code>  | <code>kCGModalPanelWindowLevel</code>  |
| <code>#define NSPopUpMenuWindowLevel</code>   | <code>kCGPopUpMenuWindowLevel</code>   |
| <code>#define NSScreenSaverWindowLevel</code> | <code>kCGScreenSaverWindowLevel</code> |

#### Constants

`NSNormalWindowLevel`

The default level for `NSWindow` objects.

Available in Mac OS X v10.0 and later.

Declared in `NSWindow.h`.

`NSFloatingWindowLevel`

Useful for floating palettes.

Available in Mac OS X v10.0 and later.

Declared in `NSWindow.h`.

`NSSubmenuWindowLevel`

Reserved for submenus. Synonymous with `NSTornOffMenuWindowLevel`, which is preferred.

Available in Mac OS X v10.0 and later.

Declared in `NSWindow.h`.

`NSTornOffMenuWindowLevel`

The level for a torn-off menu. Synonymous with `NSSubmenuWindowLevel`.

Available in Mac OS X v10.0 and later.

Declared in `NSWindow.h`.

`NSModalPanelWindowLevel`

The level for a modal panel.

Available in Mac OS X v10.0 and later.

Declared in `NSWindow.h`.

`NSMainMenuWindowLevel`

Reserved for the application's main menu.

Available in Mac OS X v10.0 and later.

Declared in `NSWindow.h`.

`NSStatusWindowLevel`

The level for a status window.

Available in Mac OS X v10.0 and later.

Declared in `NSWindow.h`.

`NSPopUpMenuWindowLevel`

The level for a pop-up menu.

Available in Mac OS X v10.0 and later.

Declared in `NSWindow.h`.

`NSScreenSaverWindowLevel`

The level for a screen saver.

Available in Mac OS X v10.0 and later.

Declared in `NSWindow.h`.

#### Declared In

`NSWindow.h`

## Display Device—Descriptions

These constants are the keys for device description dictionaries used by [deviceDescription](#) (page 3252).

```
NSString *NSDeviceResolution;
NSString *NSDeviceColorSpaceName;
NSString *NSDeviceBitsPerSample;
NSString *NSDeviceIsScreen;
NSString *NSDeviceIsPrinter;
NSString *NSDeviceSize;
```

#### Constants

`NSDeviceResolution`

The corresponding value is an `NSValue` object containing a value of type `NSSize` that describes the window's raster resolution in dots per inch (dpi).

Available in Mac OS X v10.0 and later.

Declared in `NSGraphics.h`.

`NSDeviceColorSpaceName`

The corresponding value is an `NSString` object giving the name of the window's color space.

See “Color Space Names” in *Application Kit Constants Reference* for a list of possible values.

Available in Mac OS X v10.0 and later.

Declared in `NSGraphics.h`.

`NSDeviceBitsPerSample`

The corresponding value is an `NSNumber` object containing an integer that gives the bit depth of the window's raster image (2-bit, 8-bit, and so forth).

Available in Mac OS X v10.0 and later.

Declared in `NSGraphics.h`.

`NSDeviceIsScreen`

If there is a corresponding value, this indicates that the display device is a screen.

Available in Mac OS X v10.0 and later.

Declared in `NSGraphics.h`.

`NSDeviceIsPrinter`

If there is a corresponding value, this indicates that the display device is a printer.

Available in Mac OS X v10.0 and later.

Declared in `NSGraphics.h`.

`NSDeviceSize`

The corresponding value is an `NSValue` object containing a value of type `NSSize` that gives the size of the window's frame rectangle.

Available in Mac OS X v10.0 and later.

Declared in `NSGraphics.h`.

#### Declared In

`NSGraphics.h`

## Managing Scaling Factors

This constant provides a way to manage scaling factors:

```
enum {
 NSUnscaledWindowMask = 1 << 11
};
```

#### Constants

`NSUnscaledWindowMask`

Specifies that the window is created without any scaling factors applied.

The client is responsible for all scaling operations in the window. Such a window returns 1.0 from its `userSpaceScaleFactor` method.

Currently restricted to borderless windows (`NSBorderlessWindowMask`).

Available in Mac OS X v10.4 and later.

Declared in `NSWindow.h`.

#### Declared In

`NSWindow.h`

## Controlling the Look of a Window and Its Toolbar

This constant controls the look of a window and its toolbar.

```
enum {
 NSUnifiedTitleAndToolbarWindowMask = 1 << 12
};
```

**Constants**

NSUnifiedTitleAndToolbarWindowMask

Specifies a window whose toolbar and title bar are rendered on a single continuous background.

Available in Mac OS X v10.4 and later.

Declared in `NSWindow.h`.

**Declared In**

`NSWindow.h`

**NSSelectionDirection—Direction of Key View Change**

These constants specify the direction a window is currently using to change the key view. They're used by [keyViewSelectionDirection](#) (page 3276).

```
typedef enum _NSSelectionDirection {
 NSDirectSelection = 0,
 NSSelectingNext,
 NSSelectingPrevious
} NSSelectionDirection;
```

**Constants**

NSDirectSelection

The window isn't traversing the key view loop.

Available in Mac OS X v10.0 and later.

Declared in `NSWindow.h`.

NSSelectingNext

The window is proceeding to the next valid key view.

Available in Mac OS X v10.0 and later.

Declared in `NSWindow.h`.

NSSelectingPrevious

The window is proceeding to the previous valid key view.

Available in Mac OS X v10.0 and later.

Declared in `NSWindow.h`.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSWindow.h`

**NSWindowButton—Accessing Standard Title Bar Buttons**

These constants provide a way to access standard title bar buttons:

```
typedef enum {
 NSWindowCloseButton,
 NSWindowMiniaturizeButton,
 NSWindowZoomButton,
 NSWindowToolbarButton,
 NSWindowDocumentIconButton
} NSWindowButton;
```

**Constants**

NSWindowCloseButton

The close button.

Available in Mac OS X v10.2 and later.

Declared in `NSWindow.h`.

NSWindowMiniaturizeButton

The minimize button.

Available in Mac OS X v10.2 and later.

Declared in `NSWindow.h`.

NSWindowZoomButton

The zoom button.

Available in Mac OS X v10.2 and later.

Declared in `NSWindow.h`.

NSWindowToolbarButton

The toolbar button.

Available in Mac OS X v10.2 and later.

Declared in `NSWindow.h`.

NSWindowDocumentIconButton

The document icon button.

Available in Mac OS X v10.2 and later.

Declared in `NSWindow.h`.

**Availability**

Available in Mac OS X v10.2 and later.

**Declared In**

`NSWindow.h`

**NSRunLoop—Ordering Modes for NSWindow**

These constants are passed to `NSRunLoop`'s `performSelector:target:argument:order:modes:`.

```
enum {
 NSDisplayWindowRunLoopOrdering,
 NSResetCursorRectsRunLoopOrdering
};
```

**Constants**

`NSDisplayWindowRunLoopOrdering`  
 The priority at which windows are displayed.  
 Available in Mac OS X v10.0 and later.  
 Declared in `NSWindow.h`.

`NSResetCursorRectsRunLoopOrdering`  
 The priority at which cursor rects are reset.  
 Available in Mac OS X v10.0 and later.  
 Declared in `NSWindow.h`.

**Declared In**

`NSWindow.h`

**NSWindowDepth—Window Depth**

This type represents the depth, or amount of memory, devoted to a single pixel in a window or screen. A depth of 0 indicates default depth. Window depths should not be made persistent as they will not be the same across systems.

```
typedef int NSWindowDepth;
```

**Discussion**

Use the functions [NSColorSpaceFromDepth](#) (page 3662), [NSBitsPerPixelFromDepth](#) (page 3661), and [NSPlanarFromDepth](#) (page 3686) to extract info from an `NSWindowDepth` value. Use [NSBestDepth](#) (page 3661) to compute window depths. [NSBestDepth](#) (page 3661) tries to accommodate all the parameters (match or better); if there are multiple matches, it gives the closest, with matching color space first, then bps, then planar, then bpp. bpp is “bits per pixel”; 0 indicates default (same as the number of bits per plane, either bps or bps \* [NSNumberOfColorComponents](#) (page 3684)); other values maybe used as hints to provide backing stores of different configuration: for instance, 8-bit color.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSGraphics.h`

**NSBackingStoreType—Buffered Window Drawing**

These constants specify how the drawing done in a window is buffered by the window device.

```
typedef enum _NSBackingStoreType {
 NSBackingStoreRetained = 0,
 NSBackingStoreNonretained = 1,
 NSBackingStoreBuffered = 2
} NSBackingStoreType;
```

**Constants****NSBackingStoreRetained**

The window uses a buffer, but draws directly to the screen where possible and to the buffer for obscured portions.

You should not use this mode. It combines the limitations of `NSBackingStoreNonretained` with the memory use of `NSBackingStoreBuffered`. The original NeXTSTEP implementation was an interesting compromise that worked well with fast memory mapped framebuffers on the CPU bus—something that hasn't been in general use since around 1994. These tend to have performance problems.

In Mac OS X 10.5 and later, requests for retained windows will result in the window system creating a buffered window, as that better matches actual use.

Available in Mac OS X v10.0 and later.

Declared in `NSGraphics.h`.

**NSBackingStoreNonretained**

The window draws directly to the screen without using any buffer.

You should not use this mode. It exists primarily for use in the original Classic Blue Box. It does not support Quartz drawing, alpha blending, or opacity. Moreover, it does not support hardware acceleration, and interferes with system-wide display acceleration. If you use this mode, your application must manage visibility region clipping itself, and manage repainting on visibility changes.

Available in Mac OS X v10.0 and later.

Declared in `NSGraphics.h`.

**NSBackingStoreBuffered**

The window renders all drawing into a display buffer and then flushes it to the screen.

You should use this mode. It supports hardware acceleration, Quartz drawing, and takes advantage of the GPU when possible. It also supports alpha channel drawing, opacity controls, using the compositor.

Available in Mac OS X v10.0 and later.

Declared in `NSGraphics.h`.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSGraphics.h`

**NSWindowOrderingMode**

These constants let you specify how a window is ordered relative to another window. For more information, see [orderWindow:relativeTo:](#) (page 3285).

```
typedef enum _NSWindowOrderingMode {
 NSWindowAbove = 1,
 NSWindowBelow = -1,
 NSWindowOut = 0
} NSWindowOrderingMode;
```

**Constants**

NSWindowAbove

Moves the window above the indicated window.

Available in Mac OS X v10.0 and later.

Declared in `NSGraphics.h`.

NSWindowBelow

Moves the window below the indicated window.

Available in Mac OS X v10.0 and later.

Declared in `NSGraphics.h`.

NSWindowOut

Moves the window off the screen.

Available in Mac OS X v10.0 and later.

Declared in `NSGraphics.h`.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSGraphics.h`

**NSWindowAuxiliaryOpaque**

A private data structure used internally by `NSWindow`.

```
typedef struct NSWindowAuxiliary NSWindowAuxiliaryOpaque;
```

**Availability**

Available in Mac OS X v10.0 through Mac OS X v10.3.

**Declared In**

`NSWindow.h`

**NSWindowSharingType**

These constants and data type represent the access levels other processes can have to a window's content.

```
typedef enum {
 NSWindowSharingNone = 0,
 NSWindowSharingReadOnly = 1,
 NSWindowSharingReadWrite = 2
};
typedef NSUInteger NSWindowSharingType;
```

**Constants**

NSWindowSharingNone

The window's contents cannot be read by another process.

Available in Mac OS X v10.5 and later.

Declared in `NSWindow.h`.

NSWindowSharingReadOnly

The window's contents can be read but not modified by another process.

Available in Mac OS X v10.5 and later.

Declared in `NSWindow.h`.

NSWindowSharingReadWrite

The window's contents can be read and modified by another process.

Available in Mac OS X v10.5 and later.

Declared in `NSWindow.h`.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

`NSWindow.h`

**NSWindowBackingLocation**

These constants and data type represent a window's possible backing locations.

```
enum {
 NSWindowBackingLocationDefault = 0,
 NSWindowBackingLocationVideoMemory = 1,
 NSWindowBackingLocationMainMemory = 2
};
typedef NSUInteger NSWindowBackingLocation;
```

**Constants**

NSWindowBackingLocationDefault

Determined by the operating system.

Available in Mac OS X v10.5 and later.

Declared in `NSWindow.h`.

NSWindowBackingLocationVideoMemory

Video memory.

Available in Mac OS X v10.5 and later.

Declared in `NSWindow.h`.

`NSWindowBackingLocationMainMemory`

Physical memory.

Available in Mac OS X v10.5 and later.

Declared in `NSWindow.h`.

#### Availability

Available in Mac OS X v10.5 and later.

#### Declared In

`NSWindow.h`

## Managing Window Collections

These constants and data type identify window behavior in relation to window browsers and organizers, such as Spaces.

```
enum {
 NSWindowCollectionBehaviorDefault = 0,
 NSWindowCollectionBehaviorCanJoinAllSpaces = 1 << 0,
 NSWindowCollectionBehaviorMoveToActiveSpace = 1 << 1
};
typedef NSUInteger NSWindowCollectionBehavior;
```

#### Constants

`NSWindowCollectionBehaviorDefault`

The window can be associated to one space at a time.

Available in Mac OS X v10.5 and later.

Declared in `NSWindow.h`.

`NSWindowCollectionBehaviorCanJoinAllSpaces`

The window appears in all spaces. The menu bar behaves this way.

Available in Mac OS X v10.5 and later.

Declared in `NSWindow.h`.

`NSWindowCollectionBehaviorMoveToActiveSpace`

Making the window active does not cause a space switch; the window switches to the active space.

Available in Mac OS X v10.5 and later.

Declared in `NSWindow.h`.

#### Availability

Available in Mac OS X v10.5 and later.

#### Declared In

`NSWindow.h`

## Notifications

### NSWindowDidBecomeKeyNotification

Posted whenever an `NSWindow` object becomes the key window.

The notification object is the `NSWindow` object that has become key. This notification does not contain a *userInfo* dictionary.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSWindow.h`

**NSNotificationDidBecomeMainNotification**

Posted whenever an `NSWindow` object becomes the main window.

The notification object is the `NSWindow` object that has become main. This notification does not contain a *userInfo* dictionary.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSWindow.h`

**NSNotificationDidChangeScreenNotification**

Posted whenever a portion of an `NSWindow` object's frame moves onto or off of a screen.

The notification object is the `NSWindow` object that has changed screens. This notification does not contain a *userInfo* dictionary.

This notification is not sent in Mac OS X versions earlier than 10.4.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSWindow.h`

**NSNotificationDidChangeScreenProfileNotification**

Posted whenever the display profile for the screen containing the window changes.

This notification is sent only if the window returns YES from [displaysWhenScreenProfileChanges](#) (page 3256). This notification may be sent when a majority of the window is moved to a different screen (whose profile is also different from the previous screen) or when the ColorSync profile for the current screen changes.

The notification object is the `NSWindow` object whose profile changed. This notification does not contain a *userInfo* dictionary.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

`NSWindow.h`

**NSWindowDidDeminiaturizeNotification**

Posted whenever an `NSWindow` object is deminimized.

The notification object is the `NSWindow` object that has been deminimized. This notification does not contain a *userInfo* dictionary.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSWindow.h`

**NSWindowDidEndSheetNotification**

Posted whenever an `NSWindow` object closes an attached sheet.

The notification object is the `NSWindow` object that contained the sheet. This notification does not contain a *userInfo* dictionary.

**Availability**

Available in Mac OS X v10.1 and later.

**Declared In**

`NSWindow.h`

**NSWindowDidExposeNotification**

Posted whenever a portion of a nonretained `NSWindow` object is exposed, whether by being ordered in front of other windows or by other windows being removed from in front of it.

The notification object is the `NSWindow` object that has been exposed. The *userInfo* dictionary contains the following information:

| Key                            | Value                                                                                                    |
|--------------------------------|----------------------------------------------------------------------------------------------------------|
| @ <code>"NSExposedRect"</code> | The rectangle that has been exposed (an <code>NSValue</code> object containing an <code>NSRect</code> ). |

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSWindow.h`

**NSWindowDidMiniaturizeNotification**

Posted whenever an `NSWindow` object is minimized.

The notification object is the `NSWindow` object that has been minimized. This notification does not contain a *userInfo* dictionary.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindow.h

**NSWindowDidMoveNotification**

Posted whenever an `NSWindow` object is moved.

The notification object is the `NSWindow` object that has moved. This notification does not contain a *userInfo* dictionary.

**Note:** This notification is sent when the window that moved didn't also change size. See [NSWindowDidResizeNotification](#) (page 3363) for more information.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindow.h

**NSWindowDidResignKeyNotification**

Posted whenever an `NSWindow` object resigns its status as key window.

The notification object is the `NSWindow` object that has resigned its key window status. This notification does not contain a *userInfo* dictionary.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindow.h

**NSWindowDidResignMainNotification**

Posted whenever an `NSWindow` object resigns its status as main window.

The notification object is the `NSWindow` object that has resigned its main window status. This notification does not contain a *userInfo* dictionary.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindow.h

**NSWindowDidResizeNotification**

Posted whenever an `NSWindow` object's size changes.

The notification object is the `NSWindow` object whose size has changed. This notification does not contain a *userInfo* dictionary.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindow.h

**NSNotificationDidUpdateNotification**

Posted whenever an `NSWindow` object receives an [update](#) (page 3333) message.

The notification object is the `NSWindow` object that received the [update](#) (page 3333) message. This notification does not contain a *userInfo* dictionary.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindow.h

**NSNotificationWillBeginSheetNotification**

Posted whenever an `NSWindow` object is about to open a sheet.

The notification object is the `NSWindow` object that is about to open the sheet. This notification does not contain a *userInfo* dictionary.

**Availability**

Available in Mac OS X v10.1 and later.

**Declared In**

NSWindow.h

**NSNotificationWillCloseNotification**

Posted whenever an `NSWindow` object is about to close.

The notification object is the `NSWindow` object that is about to close. This notification does not contain a *userInfo* dictionary.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindow.h

**NSNotificationWillMiniaturizeNotification**

Posted whenever an `NSWindow` object is about to be minimized.

The notification object is the `NSWindow` object that is about to be minimized. This notification does not contain a *userInfo* dictionary.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindow.h

**NSWindowWillMoveNotification**

Posted whenever an `NSWindow` object is about to move.

The notification object is the `NSWindow` object that is about to move. This notification does not contain a *userInfo* dictionary.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindow.h

## Overview

An `NSWindowController` object manages a window, usually a window stored in a nib file.

This management entails:

- Loading and displaying the window
- Closing the window when appropriate
- Customizing the window's title
- Storing the window's frame (size and location) in the defaults database
- Cascading the window in relation to other document windows of the application

A window controller can manage a window by itself or as a role player in the Application Kit's document-based architecture, which also includes `NSDocument` and `NSDocumentController` objects. In this architecture, a window controller is created and managed by a “document” (an instance of an `NSDocument` subclass) and, in turn, keeps a reference to the document.

The relationship between a window controller and a nib file is important. Although a window controller can manage a programmatically created window, it usually manages a window in a nib file. The nib file can contain other top-level objects, including other windows, but the window controller's responsibility is this

primary window. The window controller is usually the owner of the nib file, even when it is part of a document-based application. Regardless of who is the file's owner, the window controller is responsible for freeing all top-level objects in the nib file it loads.

For simple documents—that is, documents with only one nib file containing a window—you need do little directly with `NSWindowController`. The Application Kit will create one for you. However, if the default window controller is not sufficient, you can create a custom subclass of `NSWindowController`. For documents with multiple windows or panels, your document must create separate instances of `NSWindowController` (or of custom subclasses of `NSWindowController`), one for each window or panel. An example is a CAD application that has different windows for side, top, and front views of drawn objects. What you do in your `NSDocument` subclass determines whether the default `NSWindowController` or separately created and configured `NSWindowController` objects are used.

## Subclassing `NSWindowController`

You should create a subclass of `NSWindowController` when you want to augment the default behavior, such as to give the window a custom title or to perform some setup tasks before the window is loaded. In your class's initialization method, be sure to invoke on `super` either one of the `initWithWindowNibName:...` initializers or the `initWithWindow:` (page 3371) initializer. Which one depends on whether the window object originates in a nib file or is programmatically created.

Three `NSWindowController` methods are most commonly overridden:

| Method Name                                                 | Description                                                     |
|-------------------------------------------------------------|-----------------------------------------------------------------|
| <code>windowWillLoad</code> (page 3382)                     | Override to perform tasks before the window nib file is loaded. |
| <code>windowDidLoad</code> (page 3380)                      | Override to perform tasks after the window nib file is loaded.  |
| <code>windowTitleForDocumentDisplayName:</code> (page 3382) | Override to customize the window title.                         |

You can also override `loadWindow` (page 3374) to get different nib-searching or nib-loading behavior, although there is usually no need to do this.

## Adopted Protocols

### `NSCoding`

- `encodeWithCoder:`
- `initWithCoder:`

## Tasks

### Initializing NSWindowControllers

- [initWithWindow:](#) (page 3371)  
Returns a window controller initialized with a given window.
- [initWithWindowNibName:](#) (page 3372)  
Returns a window controller initialized with a nib file.
- [initWithWindowNibName:owner:](#) (page 3373)  
Returns a window controller initialized with a nib file and a specified owner for that nib file.
- [initWithWindowNibPath:owner:](#) (page 3373)  
Returns a window controller initialized with a nib file at an absolute path and a specified owner.

### Loading and Display the Window

- [loadWindow](#) (page 3374)  
Loads the receiver's window from the nib file.
- [showWindow:](#) (page 3378)  
Displays the window associated with the receiver.
- [isWindowLoaded](#) (page 3373)  
Returns whether the nib file containing the receiver's window has been loaded.
- [window](#) (page 3379)  
Returns the window owned by the receiver.
- [setWindow:](#) (page 3376)  
Sets the window controller's window.
- [windowDidLoad](#) (page 3380)  
Sent after the window owned by the receiver has been loaded.
- [windowWillLoad](#) (page 3382)  
Sent before the window owned by the receiver is loaded.

### Setting and Getting the Document

- [setDocument:](#) (page 3375)  
Sets the document associated with the window managed by the receiver.
- [document](#) (page 3371)  
Returns the document associated with the receiver.
- [setDocumentEdited:](#) (page 3375)  
Sets the document edited flag for the window controller.

## Closing the Window

- `close` (page 3370)  
Closes the window if it was loaded.
- `shouldCloseDocument` (page 3378)  
Returns whether the receiver necessarily closes the associated document when the window it manages is closed.
- `setShouldCloseDocument:` (page 3376)  
Sets whether the receiver should necessarily close the associated document when the window it manages is closed.

## Getting Nib File Information

- `owner` (page 3374)  
Returns the owner of the nib file containing the window managed by the receiver.
- `windowNibName` (page 3381)  
Returns the name of the nib file that stores the window associated with the receiver.
- `windowNibPath` (page 3381)  
Returns the full path of the nib file that stores the window associated with the receiver.

## Setting and Getting Window Attributes

- `setShouldCascadeWindows:` (page 3376)  
Sets whether the window should cascade in relation to other document windows.
- `shouldCascadeWindows` (page 3377)  
Returns whether the window will cascade in relation to other document windows when it is displayed.
- `setWindowFrameAutosaveName:` (page 3377)  
Sets the name under which the window's frame is saved in the defaults database.
- `windowFrameAutosaveName` (page 3380)  
Returns the name under which the frame rectangle of the window owned by the receiver is stored in the defaults database.
- `synchronizeWindowTitleWithDocumentName` (page 3379)  
Synchronizes the displayed window title and the represented filename with the information in the associated document.
- `windowTitleForDocumentDisplayName:` (page 3382)  
Returns the window title to be used for a given document display name.

## Instance Methods

### **close**

Closes the window if it was loaded.

- (void)close

### Discussion

Because this method closes the window without asking the user for confirmation, you usually do not invoke it when the Close menu command is chosen. Instead invoke `NSWindow`'s [performClose:](#) (page 3286) on the receiver's window. See "Window Closing Behavior" for an overview of deallocation behavior when a window is closed.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [shouldCloseDocument](#) (page 3378)
- [setShouldCloseDocument:](#) (page 3376)

### Declared In

`NSWindowController.h`

## document

Returns the document associated with the receiver.

- (id)document

### Return Value

The document associated with the receiver or `nil` if there is none.

### Discussion

When a window controller is added to a document's list of window controllers, the document sets the window controller's document with `setDocument:`. The Application Kit uses this outlet to access the document for relevant next-responder messages.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [setDocument:](#) (page 3375)

Link Snoop

PDFKitLinker2

Sketch-112

### Declared In

`NSWindowController.h`

## initWithWindow:

Returns a window controller initialized with a given window.

- (id)initWithWindow:(`NSWindow *`)window

**Parameters***window*

The window object to manage; can be `nil`.

**Return Value**

A newly initialized window controller.

**Discussion**

This method is the designated initializer for `NSWindowController`.

This initializer is useful when a window has been loaded but no window controller is assigned. The default initialization turns on cascading, sets the `shouldCloseDocument` (page 3378) flag to `NO`, and sets the window frame autosave name to an empty string. As a side effect, the created window controller is added as an observer of the `NSWindowWillCloseNotification` (page 3364)s posted by that window object (which is handled by a private method). If you make the window controller a delegate of the window, you can implement `NSWindow`'s `windowShouldClose:` (page 3345) delegate method.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSWindowController.h`

**initWithWindowNibName:**

Returns a window controller initialized with a nib file.

```
- (id)initWithWindowNibName:(NSString *)windowNibName
```

**Parameters***windowNibName*

The name of the nib file (minus the `".nib"` extension) that archives the receiver's window; cannot be `nil`.

**Discussion**

Sets the owner of the nib file to the receiver. The default initialization turns on cascading, sets the `shouldCloseDocument` (page 3378) flag to `NO`, and sets the autosave name for the window's frame to an empty string.

**Availability**

Available in Mac OS X v10.0 and later.

**Related Sample Code**

`BundleLoader`

`DockTile`

`QTKitCreateMovie`

`TrackIt`

`ViewController`

**Declared In**

`NSWindowController.h`

## initWithWindowNibName:owner:

Returns a window controller initialized with a nib file and a specified owner for that nib file.

```
- (id)initWithWindowNibName:(NSString *)windowNibName owner:(id)owner
```

### Parameters

*windowNibName*

The name of the nib file (minus the “.nib” extension) that archives the receiver’s window; cannot be nil.

*owner*

The nib file’s owner; cannot be nil.

### Discussion

The default initialization turns on cascading, sets the [shouldCloseDocument](#) (page 3378) flag to NO, and sets the autosave name for the window’s frame to an empty string.

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

NSWindowController.h

## initWithWindowNibPath:owner:

Returns a window controller initialized with a nib file at an absolute path and a specified owner.

```
- (id)initWithWindowNibPath:(NSString *)windowNibPath owner:(id)owner
```

### Parameters

*windowNibPath*

The full path to the nib file that archives the receiver’s window; cannot be nil.

*owner*

The nib file’s owner; cannot be nil.

### Discussion

Use this method if your nib file is at a fixed location (which is not inside either the file’s owner’s class’s bundle or in the application’s main bundle). The default initialization turns on cascading, sets the [shouldCloseDocument](#) (page 3378) flag to NO, and sets the autosave name for the window’s frame to an empty string.

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

NSWindowController.h

## isWindowLoaded

Returns whether the nib file containing the receiver’s window has been loaded.

```
- (BOOL)isWindowLoaded
```

**Return Value**

YES if the nib file containing the receiver's window has been loaded, NO otherwise.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [loadWindow](#) (page 3374)
- [window](#) (page 3379)
- [windowDidLoad](#) (page 3380)
- [windowWillLoad](#) (page 3382)

**Related Sample Code**

Sketch-112

**Declared In**

NSWindowController.h

## loadWindow

Loads the receiver's window from the nib file.

- (void)loadWindow

**Discussion**

You should never directly invoke this method. Instead, invoke [window](#) (page 3379) so the [windowDidLoad](#) (page 3380) and [windowWillLoad](#) (page 3382) methods are invoked. Subclasses can override this method if the way it finds and loads the window is not adequate. It uses NSBundle's `bundleForClass:` method to get the bundle, using the class of the nib file owner as argument. It then locates the nib file within the bundle and, if successful, loads it; if unsuccessful, it tries to find the nib file in the main bundle.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [isWindowLoaded](#) (page 3373)

**Declared In**

NSWindowController.h

## owner

Returns the owner of the nib file containing the window managed by the receiver.

- (id)owner

**Return Value**

The owner of the nib file containing the window managed by the receiver; usually `self`, but can be the receiver's document or some other object.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [windowNibName](#) (page 3381)

**Declared In**

NSWindowController.h

**setDocument:**

Sets the document associated with the window managed by the receiver.

- (void)setDocument:(NSDocument \*)*document*

**Parameters**

*document*

The new document.

**Discussion**

Documents automatically call this method when they add a window controller to their list of window controllers; you should not call it directly.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [document](#) (page 3371)

**Declared In**

NSWindowController.h

**setDocumentEdited:**

Sets the document edited flag for the window controller.

- (void)setDocumentEdited:(BOOL)*flag*

**Parameters**

*flag*

YES if the document has been edited since its last save, NO if it hasn't.

**Discussion**

The window controller uses this flag to control whether its associated window shows up as dirty. You should not call this method directly for window controllers with an associated document; the document calls this method on its window controllers as needed.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindowController.h

## setShouldCascadeWindows:

Sets whether the window should cascade in relation to other document windows.

- (void)setShouldCascadeWindows:(BOOL)*flag*

### Parameters

*flag*

YES if the window should cascade in relation to other document windows, NO otherwise.

### Discussion

Cascading in relation to other document windows means having a slightly offset location so that the title bars of previously displayed windows are still visible.

The default is YES.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [shouldCascadeWindows](#) (page 3377)

### Declared In

NSWindowController.h

## setShouldCloseDocument:

Sets whether the receiver should necessarily close the associated document when the window it manages is closed.

- (void)setShouldCloseDocument:(BOOL)*flag*

### Parameters

*flag*

YES if the receiver necessarily closes the associated document when the window it manages is closed, NO otherwise.

### Discussion

If NO, the document is closed only when the last remaining window of the document is closed.

The default is NO.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [shouldCloseDocument](#) (page 3378)

### Declared In

NSWindowController.h

## setWindow:

Sets the window controller's window.

```
- (void)setWindow:(NSWindow *)aWindow
```

**Parameters**

*aWindow*

The new window.

**Discussion**

This method releases the old window and any associated top-level objects in its nib file and assumes ownership of the new window. You should generally create a new window controller for a new window and release the old window controller instead of using this method.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindowController.h

**setWindowFrameAutosaveName:**

Sets the name under which the window's frame is saved in the defaults database.

```
- (void)setWindowFrameAutosaveName:(NSString *)name
```

**Parameters**

*name*

The name under which the window's frame is saved in the defaults database.

**Discussion**

By default, *name* is an empty string, causing no information to be stored in the defaults database.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [windowFrameAutosaveName](#) (page 3380)
- [setFrameAutosaveName:](#) (page 3312) (NSWindow)

**Declared In**

NSWindowController.h

**shouldCascadeWindows**

Returns whether the window will cascade in relation to other document windows when it is displayed.

```
- (BOOL)shouldCascadeWindows
```

**Return Value**

YES if the window will cascade in relation to other document windows, NO otherwise.

**Discussion**

The default is YES.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setShouldCascadeWindows:](#) (page 3376)

**Declared In**

NSWindowController.h

## shouldCloseDocument

Returns whether the receiver necessarily closes the associated document when the window it manages is closed.

- (BOOL)shouldCloseDocument

**Return Value**

YES if the receiver necessarily closes the associated document when the window it manages is closed, NO otherwise.

**Discussion**

If NO, the document is closed only when the last remaining window of the document is closed.

The default is NO.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setShouldCloseDocument:](#) (page 3376)

**Declared In**

NSWindowController.h

## showWindow:

Displays the window associated with the receiver.

- (IBAction)showWindow:(id)sender

**Parameters**

*sender*

The control sending the message; can be nil.

**Discussion**

If the window is an `NSPanel` object and has its [becomesKeyOnlyIfNeeded](#) (page 1856) flag set to YES, the window is displayed in front of all other windows but is not made key; otherwise it is displayed in front and is made key. This method is useful for menu actions.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [makeKeyAndOrderFront:](#) (page 3278) (NSWindow)  
- [orderFront:](#) (page 3283) (NSWindow)

**Related Sample Code**

CarbonCocoaCoreImageTab

CarbonQuartzComposer\_TV

CoreRecipes

CubePuzzle

Sketch-112

**Declared In**

NSWindowController.h

## synchronizeWindowTitleWithDocumentName

Synchronizes the displayed window title and the represented filename with the information in the associated document.

```
- (void)synchronizeWindowTitleWithDocumentName
```

**Discussion**

Does nothing if the window controller has no associated document or loaded window. This method queries the window controller's document to get the document's display name and full filename path, then calls [windowTitleForDocumentDisplayName:](#) (page 3382) to get the display name to show in the window title.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindowController.h

## window

Returns the window owned by the receiver.

```
- (NSWindow *)window
```

**Return Value**

The window owned by the receiver or `nil` if there isn't one.

**Discussion**

If the window has not yet been loaded, this method attempts to load the window's nib file using [loadWindow](#) (page 3374). Before it loads the window, it invokes [windowWillLoad](#) (page 3382), and if the window controller has a document, it invokes the document's corresponding method [windowControllerWillLoadNib:](#) (page 989) (if implemented). After loading the window, this method invokes [windowDidLoad](#) (page 3380) and, if there is a document, the `NSDocument` method [windowControllerDidLoadNib:](#) (page 988) (if implemented).

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [windowControllerWillLoadNib:](#) (page 989) (`NSDocument`)

**Related Sample Code**

NSWindowController.h

## windowFrameAutosaveName

Returns the name under which the frame rectangle of the window owned by the receiver is stored in the defaults database.

- (NSString \*)windowFrameAutosaveName

**Return Value**

The name under which the frame rectangle of the window owned by the receiver is stored in the defaults database.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [setWindowFrameAutosaveName:](#) (page 3377)

**Declared In**

NSWindowController.h

## windowNibName

Returns the name of the nib file that stores the window associated with the receiver.

– (NSString \*)windowNibName

**Return Value**

The name of the nib file that stores the window associated with the receiver.

**Discussion**

If [initWithWindowNibNamePath:owner:](#) (page 3373) was used to initialize the instance, `windowNibName` returns the last path component with the “.nib” extension stripped off. If [initWithWindowNibName:](#) (page 3372) or [initWithWindowNibName:owner:](#) (page 3373) was used, `windowNibName` returns the name without the “.nib” extension.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [owner](#) (page 3374)

**Related Sample Code**

CarbonCocoaCoreImageTab

CarbonQuartzComposer\_TV

ObjectPath

**Declared In**

NSWindowController.h

## windowNibPath

Returns the full path of the nib file that stores the window associated with the receiver.

– (NSString \*)windowNibPath

**Return Value**

The full path of the nib file that stores the window associated with the receiver; `nil` if it cannot be located.

**Discussion**

If [initWithWindowNibPath:owner:](#) (page 3373) was used to initialize the instance, the path is just returned. If [initWithWindowNibName:](#) (page 3372) or [initWithWindowNibName:owner:](#) (page 3373) was used, `windowNibPath` locates the nib in the file’s owner’s class’ bundle or in the application’s main bundle and returns the full path (or `nil` if it cannot be located). Subclasses can override this to augment the search behavior, but probably ought to call `super` first.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindowController.h

**windowTitleForDocumentDisplayName:**

Returns the window title to be used for a given document display name.

```
- (NSString *)windowTitleForDocumentDisplayName:(NSString *)displayName
```

**Parameters***displayName*

The display name for the document. This is the last path component under which the document file is saved.

**Discussion**

The default implementation returns *displayName*. Subclasses can override this method to customize the window title. For example, a CAD application could append “-Top” or “-Side,” depending on the view displayed by the window.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

[synchronizeWindowTitleWithDocumentName](#) (page 3379)

**Declared In**

NSWindowController.h

**windowWillLoad**

Sent before the window owned by the receiver is loaded.

```
- (void)windowWillLoad
```

**Discussion**

The default implementation does nothing.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [loadWindow](#) (page 3374)
- [window](#) (page 3379)
- [windowDidLoad](#) (page 3380)

**Declared In**

NSWindowController.h

## Overview

An `NSWorkspace` object responds to application requests to perform a variety of services:

- Opening, manipulating, and obtaining information about files and devices
- Tracking changes to the file system, devices, and the user database
- Launching applications

There is one shared `NSWorkspace` object per application. You use the class method [sharedWorkspace](#) (page 3387) to access it. For example, the following statement uses an `NSWorkspace` object to request that a file be opened in the TextEdit application:

```
[[NSWorkspace sharedWorkspace] openFile:@"Myfiles/README"
 withApplication:@"TextEdit"];
```

## Tasks

### Accessing the Shared NSWorkspace Instance

- + `sharedWorkspace` (page 3387)  
Returns the shared `NSWorkspace` instance.

### Accessing the NSWorkspace Notification Center

- `notificationCenter` (page 3400)  
Returns the notification center for workspace notifications.

### Opening Files

- `openFile:` (page 3400)  
Opens the specified file specified using the default application associated with its type.
- `openFile:withApplication:` (page 3401)  
Opens a file using the specified application.
- `openFile:fromImage:at:inView:` (page 3401)  
Opens a file using the default application for its type and animates the action using a custom icon.
- `openFile:withApplication:andDeactivate:` (page 3402)  
Opens the specified file and optionally deactivates the sending application.
- `openTempFile:` (page 3403)  
Opens the specified temporary file using the default application for its type.
- `openURL:` (page 3403)  
Opens the location at the specified URL.

### Manipulating Applications

- `launchApplication:` (page 3394)  
Launches the specified application.
- `launchApplication:showIcon:autoLaunch:` (page 3395)  
Launches the specified application using additional options.
- `hideOtherApplications` (page 3392)  
Hides all applications other than the sender.

### Manipulating Files

- `performFileOperation:source:destination:files:tag:` (page 3405)  
Performs a file operation on a set of files in a particular directory.

- `selectFile:inFileViewerRootedAtPath:` (page 3406)  
Selects the file specified by *fullPath*.

## Manipulating Uniform Type Identifier Information

- `typeOfFile:error:` (page 3408)  
Returns the uniform type identifier of the specified file, if it can be determined..
- `localizedDescriptionForType:` (page 3396)  
Returns the localized description for the specified Uniform Type Identifier
- `preferredFilenameExtensionForType:` (page 3406)  
Returns the preferred filename extension for the specified Uniform Type Identifier.
- `fileNameExtension:isValidForType:` (page 3389)  
Returns whether the specified filename extension is appropriate for the Uniform Type Identifier.
- `type:conformsToType:` (page 3408)  
Returns a Boolean indicating that the first Uniform Type Identifier conforms to the second Uniform Type Identifier.

## Requesting Information

- `iconForFile:` (page 3392)  
Returns an image containing the icon for the specified file.
- `iconForFileType:` (page 3393)  
Returns an image containing the icon for files of the specified type.
- `iconForFiles:` (page 3393)  
Returns an image containing the icon for the specified files.
- `getInfoForFile:application:type:` (page 3391)  
Retrieves information about the specified file.
- `fullPathForApplication:` (page 3390)  
Returns the full path for the specified application.
- `getFileSystemInfoForPath:isRemovable:isWritable:isUnmountable:description:type:` (page 3390)  
Describes the file system at *fullPath*.
- `isFilePackageAtPath:` (page 3394)  
Determines whether the specified path is a file package.
- `activeApplication` (page 3388)  
Returns a dictionary with information about the current active application.
- `launchedApplications` (page 3396)  
Returns an array of dictionaries, one entry for each running application.

## Image Animation

- `slideImage:from:to:` (page 3407)  
Animates a sliding image from one point to another.

## Requesting Additional Time Before Logout

- [extendPowerOffBy:](#) (page 3389)  
Requests the system wait for the specified amount of time before turning off the power or logging out the user.

## Tracking Changes to the File System

- [noteFileSystemChanged](#) (page 3398)  
Informs the `NSWorkspace` object that the file system has changed.
- [noteFileSystemChanged:](#) (page 3399)  
Informs the `NSWorkspace` object that the file system changed at the specified path.
- [fileSystemChanged](#) (page 3390)  
Returns a Boolean value indicating whether a change to the file system has been registered with a [noteFileSystemChanged](#) (page 3398) message since the last [fileSystemChanged](#) (page 3390) message.

## Updating Registered Services and File Types

- [findApplications](#) (page 3390)  
Examines all applications and updates the records of registered services and file types.

## Tracking Changes to the Defaults Database

- [noteUserDefaultsChanged](#) (page 3399)  
Informs the `NSWorkspace` object that the defaults database has changed.
- [userDefaultsChanged](#) (page 3409)  
Returns a Boolean value indicating whether a change to the defaults database has been registered with a [noteUserDefaultsChanged](#) (page 3399) message since the last [userDefaultsChanged](#) (page 3409) message.

## Tracking Status Changes for Applications and Devices

- [mountedRemovableMedia](#) (page 3397)  
Returns the full pathnames of all currently mounted removable disks.
- [mountNewRemovableMedia](#) (page 3398)  
Returns the full pathnames of any newly mounted disks.
- [mountedLocalVolumePaths](#) (page 3397)  
Returns the mount points of all local volumes, not just the removable ones returned by [mountedRemovableMedia](#) (page 3397).
- [checkForRemovableMedia](#) (page 3388)  
Polls the system's drives for any disks that have been inserted but not yet mounted.

## Providing Custom Icons

- [setIcon:forFile:options:](#) (page 3407)  
Sets the icon for the file or directory at the specified path.

## Unmounting a Device

- [unmountAndEjectDeviceAtPath:](#) (page 3409)  
Unmounts and ejects the device at the specified path.

## Working with Bundles

- [absolutePathForAppBundleWithIdentifier:](#) (page 3388)  
Returns the absolute file-system path of an application bundle.
- [launchAppWithBundleIdentifier:options:additionalEventParamDescriptor:launchIdentifier:](#) (page 3395)  
Launches the application corresponding to the specified *bundleIdentifier*.
- [openURLs:withAppBundleIdentifier:options:additionalEventParamDescriptor:launchIdentifiers:](#) (page 3404)  
Opens one or more files from an array of URLs.

## Class Methods

### sharedWorkspace

Returns the shared `NSWorkspace` instance.

```
+ (NSWorkspace *)sharedWorkspace
```

#### Return Value

The `NSWorkspace` object associated with the process.

#### Availability

Available in Mac OS X v10.0 and later.

#### Related Sample Code

CocoaDVDPlayer

MyPhoto

ObjectPath

Quartz Composer WWDC 2005 TextEdit

TextEditPlus

#### Declared In

`NSWorkspace.h`

## Instance Methods

### **absolutePathForAppBundleWithIdentifier:**

Returns the absolute file-system path of an application bundle.

- (NSString \*)absolutePathForAppBundleWithIdentifier:(NSString \*)*bundleIdentifier*

#### **Parameters**

*bundleIdentifier*

The bundle identifier string. This value corresponds to the value in the `CFBundleIdentifier` key of the application's `Info.plist` file. For example, the bundle identifier of the TextEdit application is `com.apple.TextEdit`.

#### **Return Value**

The file system path to the application bundle identified by *bundleIdentifier*, or `nil` if the bundle cannot be found.

#### **Availability**

Available in Mac OS X v10.3 and later.

#### **Related Sample Code**

Quartz Composer WWDC 2005 TextEdit  
TextEditPlus

#### **Declared In**

`NSWorkspace.h`

### **activeApplication**

Returns a dictionary with information about the current active application.

- (NSDictionary \*)activeApplication

#### **Return Value**

A dictionary with information about the application. The dictionary contains as many of the keys described in “[Constants](#)” (page 3410) as are available.

#### **Availability**

Available in Mac OS X v10.2 and later.

#### **See Also**

- [launchedApplications](#) (page 3396)

#### **Declared In**

`NSWorkspace.h`

### **checkForRemovableMedia**

Polls the system's drives for any disks that have been inserted but not yet mounted.

- (void)checkForRemovableMedia

#### Discussion

This method doesn't wait until such disks are mounted; instead, it requests that the disk be mounted asynchronously and returns immediately. Currently has no effect.

#### Availability

Available in Mac OS X v10.0 and later.

#### See Also

- [mountNewRemovableMedia](#) (page 3398)
- [mountedRemovableMedia](#) (page 3397)

#### Declared In

NSWorkspace.h

### extendPowerOffBy:

Requests the system wait for the specified amount of time before turning off the power or logging out the user.

- (NSInteger)extendPowerOffBy:(NSInteger)*requested*

#### Parameters

*requested*

The number of milliseconds to wait before turning off the power or logging off the user.

#### Return Value

The number of milliseconds granted by the system.

#### Discussion

Currently unimplemented.

#### Availability

Available in Mac OS X v10.0 and later.

#### Declared In

NSWorkspace.h

### fileNameExtension:isValidForType:

Returns whether the specified filename extension is appropriate for the Uniform Type Identifier.

- (BOOL)fileNameExtension:(NSString \*)*fileNameExtension* isValidForType:(NSString \*)*typeName*

#### Parameters

*fileNameExtension*

A string containing the filename extension.

*typeName*

A string containing the Uniform Type Identifier.

#### Return Value

YES if *fileNameExtension* is a valid extension for *typeName*, NO otherwise

## fileSystemChanged

Returns a Boolean value indicating whether a change to the file system has been registered with a [noteFileSystemChanged](#) (page 3398) message since the last [fileSystemChanged](#) (page 3390) message.

- (BOOL)fileSystemChanged

### Return Value

Currently, this method always returns NO.

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

NSWorkspace.h

## findApplications

Examines all applications and updates the records of registered services and file types.

- (void)findApplications

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

NSWorkspace.h

## fullPathForApplication:

Returns the full path for the specified application.

- (NSString \*)fullPathForApplication:(NSString \*)appName

### Parameters

*appName*

The name of the application.

### Return Value

The full path for the application, or nil if the specified application was not found.

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

NSWorkspace.h

## getFileSystemInfoForPath:isRemovable:isWritable:isUnmountable:description:type:

Describes the file system at *fullPath*.

```
- (BOOL)getFileSystemInfoForPath:(NSString *)fullPath isRemovable:(BOOL
*)removableFlag isWritable:(BOOL *)writableFlag isUnmountable:(BOOL
*)unmountableFlag description:(NSString **)description type:(NSString
**)fileSystemType
```

**Parameters***fullPath*

The path to the file-system mount point.

*removableFlag*

On input, a boolean variable; on return, this variable contains YES if the file system is on removable media.

*writableFlag*

On input, a boolean variable; on return, this variable contains YES if the file system is writable.

*unmountableFlag*

On input, a boolean variable; on return, this variable contains YES if the file system is unmountable.

*description*

On input, a pointer to a string object variable; on return, if the method was successful, this variable contains a string object that describes the file system. You should not rely on this description for program logic but can use it in message strings. Values can include “hard,” “nfs,” and “foreign.”

*fileSystemType*

On input, a pointer to a string object variable; on return, if the method was successful, this variable contains the file-system type. Values can include “HFS,” “UFS,” or other values.

**Return Value**

YES if the information was successfully returned, otherwise NO.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWorkspace.h

**getInfoForFile:application:type:**

Retrieves information about the specified file.

```
- (BOOL)getInfoForFile:(NSString *)fullPath application:(NSString **)appName
type:(NSString **)type
```

**Parameters***fullPath*

The full path to the desired file.

*appName*

The application the system would use to open the file.

*type*

On input, a pointer to a string object variable; on return, if the method is successful, this variable contains a string object with the filename extension or encoded HFS file type of the file.

**Return Value**

YES if the information was retrieved successfully; otherwise, NO if the file could not be found or the application was not associated with the file.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [iconForFile:](#) (page 3392)
- [iconForFiles:](#) (page 3393)

**Declared In**

NSWorkspace.h

## hideOtherApplications

Hides all applications other than the sender.

- (void)hideOtherApplications

**Discussion**

The user can hide all applications except the current one by Command-Option-clicking on an application's Dock icon.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWorkspace.h

## iconForFile:

Returns an image containing the icon for the specified file.

- (NSImage \*)iconForFile:(NSString \*)*fullPath*

**Parameters**

*fullPath*

The full path to the file.

**Return Value**

The icon associated with the file.

**Discussion**

The returned image has an initial size of 32 pixels by 32 pixels.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [getInfoForFile:application:type:](#) (page 3391)
- [iconForFileType:](#) (page 3393)
- [iconForFiles:](#) (page 3393)

**Related Sample Code**

bMoviePalette

bMoviePaletteCocoa

SpotlightAPI

**Declared In**

NSWorkspace.h

**iconForFiles:**

Returns an image containing the icon for the specified files.

- (NSImage \*)iconForFiles:(NSArray \*)*fullPaths*

**Parameters**

*fullPaths*

An array of NSString objects, each of which contains the full path to a file.

**Return Value**

The icon associated with the group of files.

**Discussion**

If *fullPaths* specifies one file, that file's icon is returned. If *fullPaths* specifies more than one file, an icon representing the multiple selection is returned.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [iconForFile:](#) (page 3392)
- [iconForFileType:](#) (page 3393)

**Declared In**

NSWorkspace.h

**iconForFileType:**

Returns an image containing the icon for files of the specified type.

- (NSImage \*)iconForFileType:(NSString \*)*fileType*

**Parameters**

*fileType*

The file type, which may be either a filename extension or an encoded HFS file type.

**Return Value**

The icon associated with files of the given type.

**Discussion**

The returned image has an initial size of 32 pixels by 32 pixels.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [iconForFile:](#) (page 3392)
- [iconForFiles:](#) (page 3393)

**Related Sample Code**

MyPhoto

ObjectPath

**Declared In**

NSWorkspace.h

**isFilePackageAtPath:**

Determines whether the specified path is a file package.

- (BOOL)isFilePackageAtPath:(NSString \*)*fullPath*

**Parameters***fullPath*

The full path to examine.

**Return Value**

YES if the path identifies a file package; otherwise, NO if the path does not exist, is not a directory, or is not a file package.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWorkspace.h

**launchApplication:**

Launches the specified application.

- (BOOL)launchApplication:(NSString \*)*appName*

**Parameters***appName*

The name of the application to open.

**Return Value**

YES if the application was successfully launched or was already running; otherwise, NO.

**Discussion**

The *appName* parameter need not be specified with a full path and, in the case of an application wrapper, may be specified with or without the .app extension, as described in “Use of .app Extension”.

Before this method begins, it posts an [NSWorkspaceWillLaunchApplicationNotification](#) (page 3417) to the NSWorkspace object’s notification center. When the operation is complete, it posts an [NSWorkspaceDidLaunchApplicationNotification](#) (page 3415).

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [launchApplication:showIcon:autoLaunch:](#) (page 3395)

**Related Sample Code**

QTAudioExtractionPanel

**Declared In**

NSWorkspace.h

**launchApplication:showIcon:autoLaunch:**

Launches the specified application using additional options.

```
- (BOOL)launchApplication:(NSString *)appName showIcon:(BOOL)showIcon
 autoLaunch:(BOOL)autoLaunch
```

**Parameters***appName*

The name of the application to open.

*showIcon*

If NO, the application's icon is not placed on the screen. (The icon still exists, though.)

*autoLaunch*

If YES, the autoLaunch default is set as though the specified application were autoLaunched at startup.

**Return Value**

YES if the application was successfully launched or was already running; otherwise, NO.

**Discussion**

This method is provided to enable daemon-like applications that lack a normal user interface. Its use is not generally encouraged.

Returns YES if the application is successfully launched or already running, and NO if it can't be launched.

Before this method begins, it posts an [NSWorkspaceWillLaunchApplicationNotification](#) (page 3417) to the NSWorkspace object's notification center. When the operation is complete, it posts an [NSWorkspaceDidLaunchApplicationNotification](#) (page 3415).

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [launchApplication:](#) (page 3394)

**Declared In**

NSWorkspace.h

**launchAppWithBundleIdentifier:options:additionalEventParamDescriptor:launchIdentifier:**Launches the application corresponding to the specified *bundleIdentifier*.

```
- (BOOL)launchAppWithBundleIdentifier:(NSString *)bundleIdentifier
 options:(NSWorkspaceLaunchOptions)options
 additionalEventParamDescriptor:(NSAppleEventDescriptor *)descriptor
 launchIdentifier:(NSNumber **)identifier
```

**Parameters***bundleIdentifier*

A bundle identifier string. This value corresponds to the value in the `CFBundleIdentifier` key of the application's `Info.plist` file. For example, the bundle identifier of the TextEdit application is `com.apple.TextEdit`.

*options*

Options to use when launching the application. Values for this parameter are described in [“Constants”](#) (page 3410).

*descriptor*

Additional options specified in an AppleEvent-style descriptor. For example, you could use this parameter to specify additional documents to open when the application is launched.

*identifier*

On input, a pointer to a number object variable. On return, the variable contains a number object with a unique identifier for the launch attempt. You can use this value to distinguish individual launch requests. This parameter may be `nil`.

**Return Value**

YES if the application was found and launched; otherwise, NO.

**Availability**

Available in Mac OS X v10.3 and later.

**See Also**

– [openURLs:withAppBundleIdentifier:options:additionalEventParamDescriptor:launchIdentifiers:](#) (page 3404)

**Declared In**

`NSWorkspace.h`

**launchedApplications**

Returns an array of dictionaries, one entry for each running application.

– (NSArray \*)launchedApplications

**Return Value**

An array of `NSDictionary` objects. Each dictionary contains as many of the keys described in [“Constants”](#) (page 3410) as are available.

**Availability**

Available in Mac OS X v10.2 and later.

**See Also**

– [activeApplication](#) (page 3388)

**Declared In**

`NSWorkspace.h`

**localizedDescriptionForType:**

Returns the localized description for the specified Uniform Type Identifier

```
- (NSString *)localizedDescriptionForType:(NSString *)typeName
```

**Parameters**

*typeName*

A string containing the Uniform Type Identifier.

**Return Value**

An NSString containing the localized description of *typeName*.

**Discussion**

The localized description is suitable for displaying to the user.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSWorkspace.h

## mountedLocalVolumePaths

Returns the mount points of all local volumes, not just the removable ones returned by [mountedRemovableMedia](#) (page 3397).

```
- (NSArray *)mountedLocalVolumePaths
```

**Return Value**

An array of NSString objects, each of which contains the full pathname of the mount point for any local volumes.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWorkspace.h

## mountedRemovableMedia

Returns the full pathnames of all currently mounted removable disks.

```
- (NSArray *)mountedRemovableMedia
```

**Return Value**

An array of NSString objects, each of which contains the full pathname of a mounted removable disk.

**Discussion**

If the computer provides an interrupt or other notification when the user inserts a disk into a drive, the Finder will mount the disk immediately. However, if no notification is given, the Finder won't be aware that a disk needs to be mounted. On such systems, an application should invoke either [mountNewRemovableMedia](#) (page 3398) or [checkForRemovableMedia](#) (page 3388) before invoking [mountedRemovableMedia](#) (page 3397). Either of these methods cause the Finder to poll the drives to see if a disk is present. If a disk has been inserted but not yet mounted, these methods will cause the Finder to mount it.

The Disk button in an Open or Save panel invokes [mountedRemovableMedia](#) (page 3397) and [mountNewRemovableMedia](#) (page 3398) as part of its operation, so most applications won't need to invoke these methods directly.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [checkForRemovableMedia](#) (page 3388)
- [mountNewRemovableMedia](#) (page 3398)

**Related Sample Code**

CocoaDVDPlayer

**Declared In**

NSWorkspace.h

## mountNewRemovableMedia

Returns the full pathnames of any newly mounted disks.

- (NSArray \*)mountNewRemovableMedia

**Return Value**

An array of NSString objects, each of which contains the full pathname to a newly mounted disk.

**Discussion**

This method polls the system's drives for any disks that have been inserted but not yet mounted and waits until the new disks have been mounted. This method posts an [NSWorkspaceDidMountNotification](#) (page 3415) to the NSWorkspace object's notification center when it is finished. Currently provides the same functionality as [mountedRemovableMedia](#) (page 3397).

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [checkForRemovableMedia](#) (page 3388)
- [mountedRemovableMedia](#) (page 3397)

**Declared In**

NSWorkspace.h

## noteFileSystemChanged

Informs the NSWorkspace object that the file system has changed.

- (void)noteFileSystemChanged

**Discussion**

The NSWorkspace object then gets the status of all the files and directories it is interested in and updates itself appropriately. This method is used by many objects that write or delete files.

The `NSDocument` and `NSSavePanel` objects use this method when saving a file. If you create a file directly, you should call `noteFileSystemChanged` (page 3398) so that the Finder can update the folder if it is open.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [fileSystemChanged](#) (page 3390)

**Declared In**

`NSWorkspace.h`

## **noteFileSystemChanged:**

Informs the `NSWorkspace` object that the file system changed at the specified path.

```
- (void)noteFileSystemChanged:(NSString *)path
```

**Parameters**

*path*

The full path that changed.

**Discussion**

The `NSWorkspace` object then gets the status of all the files and directories it is interested in and updates itself appropriately. This method is used by many objects that write or delete files.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [fileSystemChanged](#) (page 3390)

**Related Sample Code**

Quartz Composer WWDC 2005 TextEdit  
TextEditPlus

**Declared In**

`NSWorkspace.h`

## **noteUserDefaultsChanged**

Informs the `NSWorkspace` object that the defaults database has changed.

```
- (void)noteUserDefaultsChanged
```

**Discussion**

The `NSWorkspace` object then reads all the defaults it is interested in and reconfigures itself appropriately. For example, this method is used by the Preferences application to notify the Finder whether the user prefers to see hidden files. Currently has no effect.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [userDefaultsChanged](#) (page 3409)

**Declared In**

NSWorkspace.h

## notificationCenter

Returns the notification center for workspace notifications.

- (NSNotificationCenter \*)notificationCenter

**Return Value**

The notification center object.

**Availability**

Available in Mac OS X v10.0 and later.

**Related Sample Code**

CocoaDVDPlayer

**Declared In**

NSWorkspace.h

## openFile:

Opens the specified file specified using the default application associated with its type.

- (BOOL)openFile:(NSString \*)fullPath

**Parameters**

*fullPath*

The full path to the file.

**Return Value**

YES if the file was successfully opened; otherwise, NO.

**Discussion**

The sending application is deactivated before the request is sent.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [openFile:fromImage:at:inView:](#) (page 3401)
- [openFile:withApplication:](#) (page 3401)
- [openFile:withApplication:andDeactivate:](#) (page 3402)
- [openTempFile:](#) (page 3403)

**Related Sample Code**

CIAnnotation

DockTile

Quartz Composer WWDC 2005 TextEdit

TextEditPlus

UIElementInspector

**Declared In**

NSWorkspace.h

**openFile:fromImage:at:inView:**

Opens a file using the default application for its type and animates the action using a custom icon.

```
- (BOOL)openFile:(NSString *)fullPath fromImage:(NSImage *)anImage at:(NSPoint)point
 inView:(NSView *)aView
```

**Parameters***fullPath*

The full path to the file.

*anImage*

The icon for the file.

*point*

The point in *aView* at which to display the icon.

*aView*

The view in which to display the icon.

**Return Value**

YES if the file was successfully opened; otherwise, NO.

**Discussion**

The Finder provides an animation before opening the file to give the user feedback that the file is to be opened. To provide this animation, *anImage* should contain an icon for the file, and its image should be displayed at *point*, specified in the coordinates of *aView*. Currently provides the same functionality as [openFile:](#) (page 3400).

The sending application is deactivated before the request is sent.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [openFile:](#) (page 3400)
- [openFile:withApplication:](#) (page 3401)
- [openFile:withApplication:andDeactivate:](#) (page 3402)
- [openTempFile:](#) (page 3403)

**Declared In**

NSWorkspace.h

**openFile:withApplication:**

Opens a file using the specified application.

```
- (BOOL)openFile:(NSString *)fullPath withApplication:(NSString *)appName
```

**Parameters***fullPath*

The full path to the file.

*appName*

The name of the application to use when opening the file.

**Return Value**

YES if the file was successfully opened; otherwise, NO.

**Discussion**

The *appName* parameter need not be specified with a full path and, in the case of an application wrapper, may be specified with or without the `.app` extension, as described in “Use of .app Extension”. The sending application is deactivated before the request is sent.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [openFile:](#) (page 3400)
- [openFile:withApplication:andDeactivate:](#) (page 3402)

**Related Sample Code**

CIVideoDemoGL

ExtractMovieAudioToAIFF

Quartz Composer WWDC 2005 TextEdit

TextEditPlus

WhackedTV

**Declared In**

NSWorkspace.h

**openFile:withApplication:andDeactivate:**

Opens the specified file and optionally deactivates the sending application.

```
- (BOOL)openFile:(NSString *)fullPath withApplication:(NSString *)appName
andDeactivate:(BOOL)flag
```

**Parameters***fullPath*

The full path to the file.

*appName*

The name of the application to use when opening the file.

*flag*

If YES, the sending application is deactivated before the request is sent, allowing the opening application to become the active application.

**Return Value**

YES if the file was successfully opened; otherwise, NO.

**Discussion**

The *appName* parameter need not be specified with a full path and, in the case of an application wrapper, may be specified with or without the `.app` extension, as described in “Use of .app Extension”. If *appName* is `nil`, the default application for the file's type is used.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [openFile:](#) (page 3400)
- [openFile:withApplication:](#) (page 3401)
- [application:openFile:](#) (page 181) (NSApplication delegate method)

**Related Sample Code**

Core Data HTML Store

**Declared In**

`NSWorkspace.h`

**openTempFile:**

Opens the specified temporary file using the default application for its type.

– (BOOL)openTempFile:(NSString \*)*fullPath*

**Parameters**

*fullPath*

The full path to the temporary file.

**Return Value**

YES if the file was successfully opened; otherwise, NO.

**Discussion**

The sending application is deactivated before the request is sent. Using this method instead of one of the `openFile:...` methods lets the receiving application know that it should delete the file when it no longer needs it. Currently provides the same functionality as [openFile:](#) (page 3400).

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [openFile:](#) (page 3400)
- [openFile:fromImage:at:inView:](#) (page 3401)
- [openFile:withApplication:](#) (page 3401)
- [openFile:withApplication:andDeactivate:](#) (page 3402)

**Declared In**

`NSWorkspace.h`

**openURL:**

Opens the location at the specified URL.

```
- (BOOL)openURL:(NSURL *)url
```

**Parameters**

*url*

A URL specifying the location to open.

**Return Value**

YES if the location was successfully opened; otherwise, NO.

**Availability**

Available in Mac OS X v10.0 and later.

**Related Sample Code**

NSOperationSample

ObjectPath

PredicateEditorSample

QT Capture Widget

VertexPerformanceTest

**Declared In**

NSWorkspace.h

## openURLs:withAppBundleIdentifier:options:additionalEventParamDescriptor:launchIdentifiers:

Opens one or more files from an array of URLs.

```
- (BOOL)openURLs:(NSArray *)urls withAppBundleIdentifier:(NSString *)bundleIdentifier
 options:(NSWorkspaceLaunchOptions *)options
 additionalEventParamDescriptor:(NSAppleEventDescriptor *)descriptor
 launchIdentifiers:(NSArray **)identifiers
```

**Parameters**

*urls*

An array of NSURL objects, each one identifying a URL for the application to open.

*bundleIdentifier*

A bundle identifier string or nil to use the default system bindings. This value corresponds to the value in the CFBundleIdentifier key of the application's Info.plist file. For example, the bundle identifier of the TextEdit application is com.apple.TextEdit.

*options*

Options to use when launching the application. Values for this parameter are described in [“Constants”](#) (page 3410).

*descriptor*

Additional options specified in an AppleEvent-style descriptor. For example, you could use this parameter to specify additional documents to open when the application is launched.

*identifiers*

On input, a pointer to an array object variable. On return, the variable contains an array of NSNumber objects. Each number object contains a unique identifier (one for each URL) for the launch attempt. You can use these values to distinguish individual launch requests. This parameter may be nil.

**Return Value**

YES if the application was found and launched; otherwise, NO.

**Availability**

Available in Mac OS X v10.3 and later.

**See Also**

– [launchAppWithBundleIdentifier:options:additionalEventParamDescriptor:launchIdentifier:](#) (page 3395)

**Related Sample Code**

NewsReader

**Declared In**

NSWorkspace.h

**performFileOperation:source:destination:files:tag:**

Performs a file operation on a set of files in a particular directory.

```
– (BOOL)performFileOperation:(NSString *)operation source:(NSString *)source
 destination:(NSString *)destination files:(NSArray *)files tag:(NSInteger *)tag
```

**Parameters**

*operation*

The file operation to perform. The possible values for this parameter are described in “[Constants](#)” (page 3410).

*source*

The full path to the directory containing the files on which to operate.

*destination*

The full path to the destination directory of the operation.

*files*

An array of `NSString` objects specifying the names of the files and directories to be manipulated. Each string must not contain any path information other than the name of the file or directory. In other words, all of the files and directories must be located in the source directory and not in one of its subdirectories.

*tag*

On input, a integer variable; on return, this variable contains a negative integer if the operation fails, 0 if the operation was performed synchronously and succeeded, or a positive integer if the operation was performed asynchronously. If the value is a positive integer, the value is a tag that identifies the requested file operation.

**Return Value**

YES if the operation succeeded; otherwise, NO.

**Discussion**

Some operations—such as moving, copying, and linking files—require a destination directory to be specified. If not, *destination* should be the empty string (@" "). Before this method returns, it posts an [NSWorkspaceDidPerformFileOperationNotification](#) (page 3415) to the `NSWorkspace` object's notification center.

**Availability**

Available in Mac OS X v10.0 and later.

**Related Sample Code**

Quartz Composer WWDC 2005 TextEdit  
 TextEditPlus

**Declared In**

NSWorkspace.h

**preferredFilenameExtensionForType:**

Returns the preferred filename extension for the specified Uniform Type Identifier.

```
- (NSString *)preferredFilenameExtensionForType:(NSString *)typeName
```

**Parameters**

*typeName*

A string containing the Uniform Type Identifier.

**Return Value**

The appropriate filename extension for *typeName*, or `nil` if no extension could be determined.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSWorkspace.h

**selectFile:inFileViewerRootedAtPath:**

Selects the file specified by *fullPath*.

```
- (BOOL)selectFile:(NSString *)fullPath inFileViewerRootedAtPath:(NSString *)rootFullPath
```

**Parameters**

*fullPath*

The full path of the file to select.

*rootFullPath*

If a path is specified, a new file viewer is opened. If you specify an empty string (@" ") for this parameter, the file is selected in the main viewer.

**Return Value**

YES if the file was successfully selected; otherwise, NO.

**Availability**

Available in Mac OS X v10.0 and later.

**Related Sample Code**

EnhancedAudioBurn

**Declared In**

NSWorkspace.h

**setIcon:forFile:options:**

Sets the icon for the file or directory at the specified path.

```
- (BOOL)setIcon:(NSImage *)image forFile:(NSString *)fullPath
options:(NSWorkspaceIconCreationOptions)options
```

**Parameters**

*image*

The image to use as the icon for the file or directory.

*fullPath*

The full path of the file or directory.

*options*

The icon representations to generate from the image. You specify this value by combining the appropriate `NSWorkspaceIconCreationOptions` constants, listed in “[Constants](#)” (page 3410), using the C bitwise OR operator. Specify 0 if you want to generate icons in all available icon representation formats.

**Return Value**

YES if the icon was set; otherwise, NO.

**Discussion**

The *image* can be an arbitrary image, with or without transparency. This image is automatically scaled (as needed) to generate the icon representations. The file or folder must exist and be writable by the user.

It is recommended that applications include the `NSExclude10_4ElementsIconCreationOption` option for compatibility with pre-Mac OS X v10.3 Finder. Icons that include the high resolution elements prevent custom icons from being displayed on earlier systems.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

`NSWorkspace.h`

**slideImage:from:to:**

Animates a sliding image from one point to another.

```
- (void)slideImage:(NSImage *)image from:(NSPoint)fromPoint to:(NSPoint)toPoint
```

**Parameters**

*image*

The image to animate.

*fromPoint*

The starting point, in screen coordinates.

*toPoint*

The ending point, in screen coordinates.

**Discussion**

Currently unimplemented.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWorkspace.h

**type:conformsToType:**

Returns a Boolean indicating that the first Uniform Type Identifier conforms to the second Uniform Type Identifier.

```
- (BOOL)type:(NSString *)firstTypeName conformsToType:(NSString *)secondTypeName
```

**Parameters***firstTypeName*

A string containing the Uniform Type Identifier that should conform to *secondTypeName*.

*secondTypeName*

A string containing a Uniform Type Identifier.

**Return Value**

YES if *firstTypeName* conforms to the uniform type identifier hierarchy of *secondTypeName*, NO otherwise.

**Discussion**

Use this method instead of comparing Uniform Identifier Types for equality. See *Uniform Type Identifiers Overview* for information about Uniform Type Identifier conformance.

This method will always return YES if the two strings are equal. It is appropriate to use this method with other type names, including those declared in CFBundleTypeNameInfo.plist entries.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSWorkspace.h

**typeOfFile:error:**

Returns the uniform type identifier of the specified file, if it can be determined..

```
- (NSString *)typeOfFile:(NSString *)absoluteFilePath error:(NSError **)outError
```

**Parameters***absoluteFilePath*

The absolute path of the file.

*outError*

If the Uniform Type Identifier of the file at *absolutePath* can't be determined, *outError* contains an NSError object that describing why.

**Return Value**

An NSString containing the uniform type identifier of the file at *absoluteFilePath*. If no UTI can be determined the return value is nil.

**Discussion**

If the file at the specified path is a symbolic link, the type of the symbolic link is returned.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSWorkspace.h

**unmountAndEjectDeviceAtPath:**

Unmounts and ejects the device at the specified path.

- (BOOL)unmountAndEjectDeviceAtPath:(NSString \*)*path*

**Parameters**

*path*

The path to the device.

**Return Value**

YES if the device was unmounted; otherwise, NO.

**Discussion**

When this method begins, it posts an [NSWorkspaceWillUnmountNotification](#) (page 3418) to the `NSWorkspace` object's notification center. When it is finished, it posts an [NSWorkspaceDidUnmountNotification](#) (page 3416).

**Availability**

Available in Mac OS X v10.0 and later.

**Related Sample Code**

CocoaDVDPlayer

**Declared In**

NSWorkspace.h

**userDefaultsChanged**

Returns a Boolean value indicating whether a change to the defaults database has been registered with a [noteUserDefaultsChanged](#) (page 3399) message since the last [userDefaultsChanged](#) (page 3409) message.

- (BOOL)userDefaultsChanged

**Return Value**

Currently, this method always returns NO.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWorkspace.h

## Constants

The following table describes keys for an `NSDictionary` object containing information about an application. This dictionary is returned by `activeApplication` (page 3388) and `launchedApplications` (page 3396), and is also provided in the `userInfo` of `NSWorkspace` notifications for application launch and termination.

| Key                                                    | Value                                                                                 |
|--------------------------------------------------------|---------------------------------------------------------------------------------------|
| @ <code>"NSApplicationPath"</code>                     | The full path to the application, as a <code>NSString</code> object.                  |
| @ <code>"NSApplicationName"</code>                     | The application's name, as an <code>NSString</code> object.                           |
| @ <code>"NSApplicationBundleIdentifier"</code>         | The application's bundle identifier, as an <code>NSString</code> object.              |
| @ <code>"NSApplicationProcessIdentifier"</code>        | The application's process id, as an <code>NSNumber</code> object.                     |
| @ <code>"NSApplicationProcessSerialNumber-High"</code> | The high long of the process serial number (PSN), as an <code>NSNumber</code> object. |
| @ <code>"NSApplicationProcessSerialNumber-Low"</code>  | The low long of the process serial number (PSN), as an <code>NSNumber</code> object.  |

## File Types

These constants specify different types of files returned by `getInfoForFile:application:type:` (page 3391).

```
NSString *NSPlainFileType;
NSString *NSDirectoryFileType;
NSString *NSApplicationFileType;
NSString *NSFilesystemFileType;
NSString *NSShellCommandFileType;
```

### Constants

`NSPlainFileType`

Plain (untyped) file

Available in Mac OS X v10.0 and later.

Declared in `NSWorkspace.h`.

`NSDirectoryFileType`

Directory

Available in Mac OS X v10.0 and later.

Declared in `NSWorkspace.h`.

`NSApplicationFileType`

Cocoa application

Available in Mac OS X v10.0 and later.

Declared in `NSWorkspace.h`.

NSFilesystemFileType

File-system mount point

Available in Mac OS X v10.0 and later.

Declared in `NSWorkspace.h`.

NSShellCommandFileType

Executable shell command

Available in Mac OS X v10.0 and later.

Declared in `NSWorkspace.h`.

#### Declared In

`NSWorkspace.h`

## File Operation Constants

These constants specify different types of file operations used by `performFileOperation:source:destination:files:tag:` (page 3405).

```
NSString *NSWorkspaceMoveOperation;
NSString *NSWorkspaceCopyOperation;
NSString *NSWorkspaceLinkOperation;
NSString *NSWorkspaceCompressOperation;
NSString *NSWorkspaceDecompressOperation;
NSString *NSWorkspaceEncryptOperation;
NSString *NSWorkspaceDecryptOperation;
NSString *NSWorkspaceDestroyOperation;
NSString *NSWorkspaceRecycleOperation;
NSString *NSWorkspaceDuplicateOperation;
```

#### Constants

`NSWorkspaceMoveOperation`

Move file to destination. Behaves the same as `movePath:toPath:handler:.`

Available in Mac OS X v10.0 and later.

Declared in `NSWorkspace.h`.

`NSWorkspaceCopyOperation`

Copy file to destination. Behaves the same as `copyPath:toPath:handler:.`

Available in Mac OS X v10.0 and later.

Declared in `NSWorkspace.h`.

`NSWorkspaceLinkOperation`

Create hard link to file in destination. Behaves the same as `linkPath:toPath:handler:.`

Available in Mac OS X v10.0 and later.

Declared in `NSWorkspace.h`.

`NSWorkspaceCompressOperation`

Compress file. This operation always returns an error.

Available in Mac OS X v10.0 and later.

Declared in `NSWorkspace.h`.

`NSWorkspaceDecompressOperation`

Decompress file. This operation always returns an error.

Available in Mac OS X v10.0 and later.

Declared in `NSWorkspace.h`.

`NSWorkspaceEncryptOperation`

Encrypt file. This operation always returns an error.

Available in Mac OS X v10.0 and later.

Declared in `NSWorkspace.h`.

`NSWorkspaceDecryptOperation`

Decrypt file. This operation always returns an error.

Available in Mac OS X v10.0 and later.

Declared in `NSWorkspace.h`.

`NSWorkspaceDestroyOperation`

Destroy file. Behaves the same as `removeFileAtPath:handler:`.

Available in Mac OS X v10.0 and later.

Declared in `NSWorkspace.h`.

`NSWorkspaceRecycleOperation`

Move file to trash. The file is moved to the trash folder on the volume containing the file using the same semantics as `NSWorkspaceMoveOperation`. If a file with the same name currently exists in the trash folder, the new file is renamed. If no trash folder exists on the volume containing the file, the operation fails.

Available in Mac OS X v10.0 and later.

Declared in `NSWorkspace.h`.

`NSWorkspaceDuplicateOperation`

Duplicate file in source directory.

Available in Mac OS X v10.0 and later.

Declared in `NSWorkspace.h`.

#### Declared In

`NSWorkspace.h`

## NSWorkspaceLaunchOptions

Constants representing different launch options.

```
typedef unsigned int NSWorkspaceLaunchOptions;
```

#### Discussion

See “[Launch Options](#)” (page 3413) for possible values.

#### Availability

Available in Mac OS X v10.3 and later.

#### Declared In

`NSWorkspace.h`

## Launch Options

These constants define launch options you can pass to

[launchAppWithBundleIdentifier:options:additionalEventParamDescriptor:](#)

[launchIdentifier:](#) (page 3395) and

[openURLs:withAppBundleIdentifier:options:additionalEventParamDescriptor:](#)

[launchIdentifiers:](#) (page 3404).

```
enum {
 NSWorkspaceLaunchAndPrint = 0x00000002,
 NSWorkspaceLaunchInhibitingBackgroundOnly = 0x00000080,
 NSWorkspaceLaunchWithoutAddingToRecents = 0x00000100,
 NSWorkspaceLaunchWithoutActivation = 0x00000200,
 NSWorkspaceLaunchAsync = 0x00010000,
 NSWorkspaceLaunchAllowingClassicStartup = 0x00020000,
 NSWorkspaceLaunchPreferringClassic = 0x00040000,
 NSWorkspaceLaunchNewInstance = 0x00080000,
 NSWorkspaceLaunchAndHide = 0x00100000,
 NSWorkspaceLaunchAndHideOthers = 0x00200000,
 NSWorkspaceLaunchDefault = NSWorkspaceLaunchAsync |
 NSWorkspaceLaunchAllowingClassicStartup
};
```

### Constants

`NSWorkspaceLaunchAndPrint`

**Print items instead of opening them.**

Available in Mac OS X v10.3 and later.

Declared in `NSWorkspace.h`.

`NSWorkspaceLaunchInhibitingBackgroundOnly`

**Causes launch to fail if the target is background-only.**

Available in Mac OS X v10.3 and later.

Declared in `NSWorkspace.h`.

`NSWorkspaceLaunchWithoutAddingToRecents`

**Do not add the application or documents to the Recents menu.**

Available in Mac OS X v10.3 and later.

Declared in `NSWorkspace.h`.

`NSWorkspaceLaunchWithoutActivation`

**Launch the application but do not bring it into the foreground.**

Available in Mac OS X v10.3 and later.

Declared in `NSWorkspace.h`.

`NSWorkspaceLaunchAsync`

**Launch the application and return the results asynchronously.**

Available in Mac OS X v10.3 and later.

Declared in `NSWorkspace.h`.

`NSWorkspaceLaunchAllowingClassicStartup`

**Start up the Classic compatibility environment, if it is required by the application.**

Available in Mac OS X v10.3 and later.

Declared in `NSWorkspace.h`.

`NSWorkspaceLaunchPreferringClassic`

Force the application to launch in the Classic compatibility environment.

Available in Mac OS X v10.3 and later.

Declared in `NSWorkspace.h`.

`NSWorkspaceLaunchNewInstance`

Create a new instance of the application, even if one is already running.

Available in Mac OS X v10.3 and later.

Declared in `NSWorkspace.h`.

`NSWorkspaceLaunchAndHide`

Tell the application to hide itself as soon as it has finished launching.

Available in Mac OS X v10.3 and later.

Declared in `NSWorkspace.h`.

`NSWorkspaceLaunchAndHideOthers`

Hide all applications except the newly launched one.

Available in Mac OS X v10.3 and later.

Declared in `NSWorkspace.h`.

`NSWorkspaceLaunchDefault`

Launch the application asynchronously and launch it in the Classic environment, if required.

Available in Mac OS X v10.3 and later.

Declared in `NSWorkspace.h`.

#### Declared In

`NSWorkspace.h`

## Workspace icon creation options

These constants describe the `NSWorkspaceIconCreationOptions` values used by `setIcon:forFile:options:` (page 3407).

```
enum {
 NSExcludeQuickDrawElementsIconCreationOption = 1 << 1,
 NSExclude10_4ElementsIconCreationOption = 1 << 2
};
```

#### Constants

`NSExcludeQuickDrawElementsIconCreationOption`

Suppress generation of the QuickDraw format icon representations that are used Mac OS X v10.0 through v10.4.

Available in Mac OS X v10.4 and later.

Declared in `NSWorkspace.h`.

`NSExclude10_4ElementsIconCreationOption`

Suppress generation of the new higher resolution icon representations that are supported in Mac OS X v10.4.

Available in Mac OS X v10.4 and later.

Declared in `NSWorkspace.h`.

#### Discussion

You can combine these using the C bitwise OR operator.

**Declared In**  
 NSWorkspace.h

## Notifications

All `NSWorkspace` notifications are posted to the `NSWorkspace` object's own notification center, not the application's default notification center. Access this center using the `NSWorkspace` object's [notificationCenter](#) (page 3400) method.

### NSWorkspaceDidLaunchApplicationNotification

Posted when a new application has started up.

The notification object is the shared `NSWorkspace` instance. The *userInfo* dictionary contains the keys and values described in “[Constants](#)” (page 3410).

**Availability**  
 Available in Mac OS X v10.0 and later.

**Declared In**  
 NSWorkspace.h

### NSWorkspaceDidMountNotification

Posted when a new device has been mounted.

The notification object is the shared `NSWorkspace` instance. The *userInfo* dictionary contains the following information:

| Key                   | Value                                               |
|-----------------------|-----------------------------------------------------|
| @ <i>NSDevicePath</i> | The path where the device was mounted, as a string. |

**Availability**  
 Available in Mac OS X v10.0 and later.

**Declared In**  
 NSWorkspace.h

### NSWorkspaceDidPerformFileOperationNotification

Posted when a file operation has been performed in the receiving application.

The notification object is the shared `NSWorkspace` instance. The *userInfo* dictionary contains the following information:

| Key                        | Value                                                                                                  |
|----------------------------|--------------------------------------------------------------------------------------------------------|
| @ <i>NSOperationNumber</i> | An <code>NSNumber</code> object containing an integer indicating the type of file operation completed. |

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSWorkspace.h`

**NSWorkspaceDidTerminateApplicationNotification**

Posted when an application finishes executing.

The notification object is the shared `NSWorkspace` instance. The *userInfo* dictionary contains the keys and values described in “[Constants](#)” (page 3410).

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSWorkspace.h`

**NSWorkspaceDidWakeNotification**

Posted when the machine wakes from sleep.

The notification object is the shared `NSWorkspace` instance. The notification does not contain a *userInfo* dictionary.

**Availability**

Available in Mac OS X v10.3 and later.

**Declared In**

`NSWorkspace.h`

**NSWorkspaceDidUnmountNotification**

Posted when the Finder has unmounted a device.

The notification object is the shared `NSWorkspace` instance. The *userInfo* dictionary contains the following information:

| Key                         | Value                                                                                 |
|-----------------------------|---------------------------------------------------------------------------------------|
| @ <code>NSDevicePath</code> | The path where the device was previously mounted, as an <code>NSString</code> object. |

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSWorkspace.h`

### NSWorkspaceSessionDidBecomeActiveNotification

Posted after a user session is switched in. This allows an application to re-enable some processing when a switched out session gets switched back in, for example.

The notification object is the shared `NSWorkspace` instance. The notification does not contain a *userInfo* dictionary.

#### Availability

Available in Mac OS X v10.3 and later.

#### Declared In

`NSWorkspace.h`

### NSWorkspaceSessionDidResignActiveNotification

Posted before a user session is switched out. This allows an application to disable some processing when its user session is switched out, and re-enable when that session gets switched back in, for example.

The notification object is the shared `NSWorkspace` instance. The notification does not contain a *userInfo* dictionary.

If an application is launched in an inactive session, `NSWorkspaceSessionDidResignActiveNotification` is sent after [NSApplicationWillFinishLaunchingNotification](#) (page 204) and before sending [NSApplicationDidFinishLaunchingNotification](#) (page 203).

#### Availability

Available in Mac OS X v10.3 and later.

#### Declared In

`NSWorkspace.h`

### NSWorkspaceWillLaunchApplicationNotification

Posted when the Finder is about to launch an application.

The notification object is the shared `NSWorkspace` instance. The *userInfo* dictionary contains the keys and values described in [“Constants”](#) (page 3410).

#### Availability

Available in Mac OS X v10.0 and later.

#### Declared In

`NSWorkspace.h`

### NSWorkspaceWillPowerOffNotification

Posted when the user has requested a logout or that the machine be powered off.

The notification object is the shared `NSWorkspace` instance. This notification does not contain a *userInfo* dictionary.

#### Availability

Available in Mac OS X v10.0 and later.

**Declared In**

NSWorkspace.h

**NSWorkspaceWillSleepNotification**

Posted before the machine goes to sleep. An observer of this message can delay sleep for up to 30 seconds while handling this notification.

The notification object is the shared `NSWorkspace` instance. The notification does not contain a *userInfo* dictionary.

**Availability**

Available in Mac OS X v10.3 and later.

**Declared In**

NSWorkspace.h

**NSWorkspaceWillUnmountNotification**

Posted when the Finder is about to unmount a device. This notification will not be delivered if a volume was forcibly and immediately made unavailable, such as when a FireWire drive is simply unplugged, because there is no chance to deliver it before the volume becomes unavailable.

The notification object is the shared `NSWorkspace` instance. The *userInfo* dictionary contains the following information:

| Key                         | Value                                              |
|-----------------------------|----------------------------------------------------|
| @ <code>NSDevicePath</code> | The path where the device is mounted, as a string. |

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWorkspace.h

# Protocols

| <b>Companion guide</b> | Accessibility Programming Guidelines for Cocoa |

## Overview

The `NSAccessibility` informal protocol defines methods that Cocoa classes must implement to make themselves available to an external assistive application. An assistive application interacts with your application to allow persons with disabilities to use your application. For example, a person with a visual impairment could use an application to convert menu items and button labels into speech and then perform actions by verbal command.

Because many Cocoa user interface classes already implement the `NSAccessibility` protocol, providing reasonable default behavior in most cases, Cocoa applications built with standard widgets are automatically accessible. In general, you need to explicitly implement the `NSAccessibility` protocol methods only if you subclass one of them, adding new behavior.

The Cocoa implementations of these methods raise an `NSAccessibilityException` when errors occur, such as requesting the value of an unsupported attribute. In most cases, subclasses do not need to raise or catch these exceptions, because overridden methods should invoke their inherited methods for unrecognized attribute and action names.

See “[Accessibility](#)” (page 3647) for descriptions of Application Kit functions related to accessibility.

## Tasks

### Accessing Attributes

- [accessibilityAttributeNames](#) (page 3423)  
Returns an array of attribute names supported by the receiver.
- [accessibilityAttributeValue:](#) (page 3424)  
Returns the value of the receiver's attribute *attribute*.

- `accessibilityIsAttributeSettable:` (page 3425)  
Returns YES if the value for the receiver's attribute *attribute* can be set.
- `accessibilitySetValue:forAttribute:` (page 3427)  
Sets the value of the receiver's attribute *attribute* to *value*.
- `accessibilitySetOverrideValue:forAttribute:` (page 3427)  
Overrides the receiver's attribute *attribute*, or adds it if it does not exist, and sets its value to *value*.

## Accessing Parameterized Attributes

- `accessibilityParameterizedAttributeNames` (page 3426)  
Returns a list of parameterized attribute names supported by the receiver. If you implement this method you should also implement `accessibilityAttributeValue:forParameter:` (page 3424).
- `accessibilityAttributeValue:forParameter:` (page 3424)  
Returns the value of the receiver's parameterized attribute corresponding to *attribute* and *parameter*. If you implement this method you should also implement `accessibilityParameterizedAttributeNames` (page 3426).

## Accessing Actions

- `accessibilityActionNames` (page 3423)  
Returns an array of action names supported by the receiver.
- `accessibilityActionDescription:` (page 3422)  
Returns a localized description of the action *action*.
- `accessibilityPerformAction:` (page 3426)  
Performs the action associated with the name *action*.

## Querying Elements

- `accessibilityIsIgnored` (page 3426)  
Returns YES if the receiver should not be visible in the parent-child accessibility hierarchy.
- `accessibilityHitTest:` (page 3425)  
Returns the deepest descendant of the accessibility hierarchy that contains the point *point*, which is in lower-left relative screen coordinates.
- `accessibilityFocusedUIElement` (page 3424)  
Returns the deepest descendant of the user interface hierarchy that has the focus.

## Instance Methods

### **accessibilityActionDescription:**

Returns a localized description of the action *action*.

- (NSString \*)accessibilityActionDescription:(NSString \*)*action*

**Discussion**

A button, for example, could return the string `press button` for the `NSAccessibilityPressAction` action. User interface classes must implement this method to return descriptions for all actions returned from `accessibilityActionNames` (page 3423). Subclasses should invoke the superclass's implementation, if it exists, to obtain the descriptions of any inherited actions.

**Availability**

Available in Mac OS X v10.2 and later.

**Declared In**

`NSAccessibility.h`

## **accessibilityActionNames**

Returns an array of action names supported by the receiver.

- (NSArray \*)accessibilityActionNames

**Discussion**

User interface classes must implement this method. Subclasses should invoke the superclass's implementation, if it exists, and append additional action names or remove unsupported actions. Some common action names are defined by Cocoa and are described in the “[Constants](#)” (page 3428) section.

**Availability**

Available in Mac OS X v10.2 and later.

**Related Sample Code**

Clock Control

Dicey

ImageMapExample

TrackBall

**Declared In**

`NSAccessibility.h`

## **accessibilityAttributeNames**

Returns an array of attribute names supported by the receiver.

- (NSArray \*)accessibilityAttributeNames

**Discussion**

User interface classes must implement this method. Subclasses should invoke the superclass's implementation, if it exists, and append additional attributes or remove unsupported attributes. Some attribute names are defined by Cocoa and are described in the “[Constants](#)” (page 3428) section.

**Availability**

Available in Mac OS X v10.2 and later.

**Related Sample Code**

Clock Control

Dicey

ImageMapExample  
TrackBall

**Declared In**

NSAccessibility.h

**accessibilityAttributeValue:**

Returns the value of the receiver's attribute *attribute*.

```
- (id)accessibilityAttributeValue:(NSString *)attribute
```

**Discussion**

User interface classes must implement this method. Subclasses should invoke the superclass's implementation, if it exists, if *attribute* is not implemented in the subclass.

**Availability**

Available in Mac OS X v10.2 and later.

**Declared In**

NSAccessibility.h

**accessibilityAttributeValue:forParameter:**

Returns the value of the receiver's parameterized attribute corresponding to *attribute* and *parameter*.

If you implement this method you should also implement

[accessibilityParameterizedAttributeNames](#) (page 3426).

```
- (id)accessibilityAttributeValue:(NSString *)attribute forParameter:(id)parameter
```

**Availability**

Available in Mac OS X v10.3 and later.

**Declared In**

NSAccessibility.h

**accessibilityFocusedUIElement**

Returns the deepest descendant of the user interface hierarchy that has the focus.

```
- (id)accessibilityFocusedUIElement
```

**Discussion**

You can assume that the search for the focus has already been narrowed down to the receiver. Override this method to do deeper searching by identifying which child element, if any, may have the focus. If a child element does not have the focus, either return `self` or, if available, invoke the superclass's implementation. The default `NSView` and `NSCell` implementations test whether the receiver is an ignored element and, if so, return the receiver's first unignored parent; otherwise they return `self`.

**Availability**

Available in Mac OS X v10.2 and later.

**Related Sample Code**

Dicey

ImageMapExample

TrackBall

**Declared In**

NSAccessibility.h

**accessibilityHitTest:**

Returns the deepest descendant of the accessibility hierarchy that contains the point *point*, which is in lower-left relative screen coordinates.

```
- (id)accessibilityHitTest:(NSPoint)point
```

**Discussion**

You can assume the point has already been determined to lie within the receiver. Override this method to do deeper hit-testing by identifying which child element, if any, contains the point. `NSMatrix`, for example, identifies which of its cells contains *point* and propagates the hit-test to it. If *point* is not contained within one of the receiver's children, either return `self` or, if available, invoke the superclass's implementation. The default `NSView` and `NSCell` implementations test whether the receiver is an ignored element and, if so, return the receiver's first unignored parent; otherwise they return `self`.

**Availability**

Available in Mac OS X v10.2 and later.

**Related Sample Code**

Dicey

ImageMapExample

**Declared In**

NSAccessibility.h

**accessibilityIsAttributeSettable:**

Returns YES if the value for the receiver's attribute *attribute* can be set.

```
- (BOOL)accessibilityIsAttributeSettable:(NSString *)attribute
```

**Discussion**

User interface classes must implement this method. Subclasses should invoke the superclass's implementation, if it exists, if *attribute* is not implemented in the subclass.

**Availability**

Available in Mac OS X v10.2 and later.

**Declared In**

NSAccessibility.h

## accessibilityIsIgnored

Returns YES if the receiver should not be visible in the parent-child accessibility hierarchy.

- (BOOL)accessibilityIsIgnored

### Discussion

In other words, when asking for an object's children, ignored children should not be included; instead, the ignored children should be replaced by their own unignored children. The same applies when asking for an object's parent; an ignored parent should be skipped and the first unignored ancestor treated as the real parent. Likewise, when a hit-test or focus test is satisfied by an ignored element, the element's first unignored ancestor (or descendant in certain cases, such as single-celled controls) should be used instead.

Ignored elements allow the accessibility hierarchy to be a simplified version of the view and object ownership hierarchies. Intermediate objects can be bypassed and the real user interface objects accessed more quickly. For example, `NSControl` objects are ignored when they are single-celled; the visible parent-child relationship is between the control's parent (or a higher ancestor if the parent is ignored, too) and the control's cell.

### Availability

Available in Mac OS X v10.2 and later.

### Related Sample Code

Dicey

ImageMapExample

TrackBall

### Declared In

NSAccessibility.h

## accessibilityParameterizedAttributeNames

Returns a list of parameterized attribute names supported by the receiver. If you implement this method you should also implement [accessibilityAttributeValue:forParameter:](#) (page 3424).

- (NSArray \*)accessibilityParameterizedAttributeNames

### Availability

Available in Mac OS X v10.3 and later.

### Declared In

NSAccessibility.h

## accessibilityPerformAction:

Performs the action associated with the name *action*.

- (void)accessibilityPerformAction:(NSString \*)*action*

### Discussion

User interface classes must implement this method to handle all the actions returned from [accessibilityActionNames](#) (page 3423). Subclasses should invoke the superclass's implementation, if it exists, if *action* is not implemented in the subclass.

**Availability**

Available in Mac OS X v10.2 and later.

**Declared In**

NSAccessibility.h

**accessibilitySetOverrideValue:forAttribute:**

Overrides the receiver's attribute *attribute*, or adds it if it does not exist, and sets its value to *value*.

```
-(BOOL)accessibilitySetOverrideValue:(id)value forAttribute:(NSString *)attribute
```

**Discussion**

This method is for changing the set of attributes on an instance, as an alternative to subclassing. The return value indicates if the override was successful.

This method only works on objects whose class already implements the `NSAccessibility` protocol. If the specified attribute is already supported by the object, the value specified by this method wins.

If the specified attribute does not exist it is created. This is done outside the `NSAccessibility` protocol, so `accessibilityAttributeNames` still returns the old list which does not contain the new attribute. Likewise, `accessibilityAttributeValue` does not return attributes created by the override process nor does it return their overridden values.

The values of overridden attributes are not settable by assistive applications.

If you need to undo the effect of using this method, call it again passing `nil` for the value.

Ensure that you invoke this method on the actual object that represents the user interface element. For example, in the case of `NSButton`, use the underlying `NSButtonCell`. The `NSButton` itself is ignored by accessibility.

This method works only on an object representing a single user interface element. So, for example, you cannot use it when a single object represents multiple user interface elements, as with `NSSegmentedCell`, which has only a single object but provides user interface elements for each segment).

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

NSAccessibility.h

**accessibilitySetValue:forAttribute:**

Sets the value of the receiver's attribute *attribute* to *value*.

```
-(void)accessibilitySetValue:(id)value forAttribute:(NSString *)attribute
```

**Discussion**

User interface classes must implement this method if any of its attributes are settable. Subclasses should invoke the superclass's implementation, if it exists, if *attribute* is not implemented in the subclass.

**Availability**

Available in Mac OS X v10.2 and later.

**Declared In**

NSAccessibility.h

## Constants

NSAccessibility defines numerous attribute names. Some can be used by any object; others are specific to a particular type of object.

### Standard attributes for any object

The following are the standard attributes that can be adopted by any object.

```
NSString *const NSAccessibilityChildrenAttribute;
NSString *const NSAccessibilityContentsAttribute;
NSString *const NSAccessibilityDescriptionAttribute;
NSString *const NSAccessibilityEnabledAttribute;
NSString *const NSAccessibilityFocusedAttribute;
NSString *const NSAccessibilityHelpAttribute;
NSString *const NSAccessibilityMaxValueAttribute;
NSString *const NSAccessibilityMinValueAttribute;
NSString *const NSAccessibilityParentAttribute;
NSString *const NSAccessibilityPositionAttribute;
NSString *const NSAccessibilityRoleAttribute;
NSString *const NSAccessibilityRoleDescriptionAttribute;
NSString *const NSAccessibilitySelectedChildrenAttribute;
NSString *const NSAccessibilityShownMenuAttribute;
NSString *const NSAccessibilitySizeAttribute;
NSString *const NSAccessibilitySubroleAttribute;
NSString *const NSAccessibilityTitleAttribute;
NSString *const NSAccessibilityTopLevelUIElementAttribute;
NSString *const NSAccessibilityValueAttribute;
NSString *const NSAccessibilityValueDescriptionAttribute;
NSString *const NSAccessibilityVisibleChildrenAttribute;
NSString *const NSAccessibilityWindowAttribute;
```

**Constants**

NSAccessibilityChildrenAttribute

Elements that current element contains (NSArray)

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityContentsAttribute

Elements that represent the contents in the current element, such as the document view of a scroll view (NSArray)

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityDescriptionAttribute

Instance description (NSString)

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

`NSAccessibilityEnabledAttribute`

Flag indicating enabled state of element (NSNumber)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityFocusedAttribute`

Flag indicating presence of keyboard focus (NSNumber)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityHelpAttribute`

Instance description, such as a help tag string (NSString)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityMaxValueAttribute`

Element's maximum value (id)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityMinValueAttribute`

Element's minimum value (id)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityParentAttribute`

Element containing current element (id)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityPositionAttribute`

Screen position of element's lower-left corner in lower-left relative screen coordinates (NSValue)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityRoleAttribute`

Element type, such as `NSAccessibilityRadioButtonRole` (NSString). See the role attribute table below

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityRoleDescriptionAttribute`

Localized, user-readable description of role, such as `radio button` (NSString)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilitySelectedChildrenAttribute`

Currently selected children (NSArray)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityShownMenuAttribute`

Menu currently being displayed (id)

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilitySizeAttribute`

Element size (NSValue)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilitySubroleAttribute`

Element subrole type, such as `NSAccessibilityTableRowSubrole` (NSString). See the subrole attribute table below.

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityTitleAttribute`

Title of element, such as button text (NSString)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityTopLevelUIElementAttribute`

User interface element for the top-level element (id)

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityValueAttribute`

Element's value (id)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityValueDescriptionAttribute`

Text description of value (NSString)

Available in Mac OS X v10.5 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityVisibleChildrenAttribute`

Child elements that are visible (NSArray)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityWindowAttribute`

Window containing current element (id)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

#### Declared In

`NSAccessibility.h`

## Text-specific attributes

The following are attributes specific to text.

```

NSString *const NSAccessibilityInsertionPointLineNumberAttribute;
NSString *const NSAccessibilityNumberOfCharactersAttribute;
NSString *const NSAccessibilitySelectedTextAttribute;
NSString *const NSAccessibilitySelectedTextRangeAttribute;
NSString *const NSAccessibilitySelectedTextRangesAttribute;
NSString *const NSAccessibilitySharedCharacterRangeAttribute;
NSString *const NSAccessibilitySharedTextUIElementsAttribute;
NSString *const NSAccessibilityVisibleCharacterRangeAttribute;

```

**Constants**

NSAccessibilityInsertionPointLineNumberAttribute

**Line number containing caret** (NSNumber)

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilityNumberOfCharactersAttribute

**Number of characters** (NSNumber)

Available in Mac OS X v10.3 and later.

Declared in NSAccessibility.h.

NSAccessibilitySelectedTextAttribute

**Currently selected text** (NSString)

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilitySelectedTextRangeAttribute

**Range of selected text** (NSValue)

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilitySelectedTextRangesAttribute

**Array of NSValue (rangeValue) ranges of selected text** (NSArray)

Available in Mac OS X v10.5 and later.

Declared in NSAccessibility.h.

NSAccessibilitySharedCharacterRangeAttribute

**The (rangeValue) part of shared text in this view** (NSValue)

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilitySharedTextUIElementsAttribute

**Text views sharing text** (NSArray)

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilityVisibleCharacterRangeAttribute

**Range of visible text** (NSValue). Returns ranges for entire lines. For example, characters that are horizontally clipped will be reported in the visible range.

Available in Mac OS X v10.3 and later.

Declared in NSAccessibility.h.

**Declared In**

NSAccessibility.h

## Parameterized text-specific attributes

Parameterized attributes behave similar to a function by allowing you to pass a parameter when requesting an attribute value. The following are parameterized attributes specific to text:

```
NSString *const NSAccessibilityAttributedStringForRangeParameterizedAttribute;
NSString *const NSAccessibilityBoundsForRangeParameterizedAttribute;
NSString *const NSAccessibilityLineForIndexParameterizedAttribute;
NSString *const NSAccessibilityRTFForRangeParameterizedAttribute;
NSString *const NSAccessibilityRangeForIndexParameterizedAttribute;
NSString *const NSAccessibilityRangeForLineParameterizedAttribute;
NSString *const NSAccessibilityRangeForPositionParameterizedAttribute;
NSString *const NSAccessibilityStringForRangeParameterizedAttribute;
NSString *const NSAccessibilityStyleRangeForIndexParameterizedAttribute;
```

### Constants

`NSAccessibilityLineForIndexParameterizedAttribute`

The line number (NSNumber) of the specified character (NSNumber)

Available in Mac OS X v10.3 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityRangeForLineParameterizedAttribute`

The range of characters (NSValue containing an NSRange) corresponding to the specified line number (NSNumber).

Available in Mac OS X v10.3 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityStringForRangeParameterizedAttribute`

The substring (NSString) specified by the range (NSValue containing an NSRange)

Available in Mac OS X v10.3 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityRangeForPositionParameterizedAttribute`

The range of characters (NSValue containing an NSRange) composing the glyph at the specified point (NSValue containing NSPoint)

Available in Mac OS X v10.3 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityRangeForIndexParameterizedAttribute`

The full range of characters (NSValue containing an NSRange), including the specified character, which compose a single glyph (NSNumber)

Available in Mac OS X v10.3 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityBoundsForRangeParameterizedAttribute`

The rectangle (NSValue containing an NSRect) enclosing the specified range of characters (NSValue containing an NSRange). If the range crosses a line boundary, the returned rectangle will fully enclose all the lines of characters.

Available in Mac OS X v10.3 and later.

Declared in `NSAccessibility.h`.

NSAccessibilityRTFForRangeParameterizedAttribute

The RTF data (NSData) describing the specified range of characters (NSValue containing an NSRange)

Available in Mac OS X v10.3 and later.

Declared in NSAccessibility.h.

NSAccessibilityStyleRangeForIndexParameterizedAttribute

The full range of characters (NSValue containing an NSRange), including the specified character (NSNumber), which have the same style

Available in Mac OS X v10.3 and later.

Declared in NSAccessibility.h.

NSAccessibilityAttributedStringForRangeParameterizedAttribute

Does not use attributes from AppKit/AttributedString.h (NSAttributedString)

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

### Declared In

NSAccessibility.h

## Text attributed string attributes and constants

The following attributes and key constants are used with attributed strings:

```
NSString *const NSAccessibilityAttachmentTextAttribute;
NSString *const NSAccessibilityBackgroundColorTextAttribute;
NSString *const NSAccessibilityFontFamilyKey;
NSString *const NSAccessibilityFontNameKey;
NSString *const NSAccessibilityFontSizeKey;
NSString *const NSAccessibilityFontTextAttribute;
NSString *const NSAccessibilityForegroundColorTextAttribute;
NSString *const NSAccessibilityLinkTextAttribute;
NSString *const NSAccessibilityMisspelledTextAttribute;
NSString *const NSAccessibilityShadowTextAttribute;
NSString *const NSAccessibilityStrikethroughColorTextAttribute;
NSString *const NSAccessibilityStrikethroughTextAttribute;
NSString *const NSAccessibilitySuperscriptTextAttribute;
NSString *const NSAccessibilityUnderlineColorTextAttribute;
NSString *const NSAccessibilityUnderlineTextAttribute;
NSString *const NSAccessibilityVisibleNameKey;
```

### Constants

NSAccessibilityForegroundColorTextAttribute

Text foreground color (CGColorRef)

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilityBackgroundColorTextAttribute

Text background color (CGColorRef)

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilityUnderlineColorTextAttribute

Text underline color (CGColorRef)

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilityStrikethroughColorTextAttribute

Text strikethrough color (CGColorRef)

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilityUnderlineTextAttribute

Text underline style (NSNumber)

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilitySuperscriptTextAttribute

Text superscript style (NSNumber). Values > 0 are superscript; values < 0 are subscript.

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilityStrikethroughTextAttribute

Text strikethrough (NSNumber as a Boolean value)

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilityShadowTextAttribute

Text shadow (NSNumber as a Boolean value)

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilityAttachmentTextAttribute

Text attachment (id)

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilityLinkTextAttribute

Text link (id)

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilityMisspelledTextAttribute

Misspelled text (NSNumber as a Boolean value)

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilityFontTextAttribute

Font keys (NSDictionary)

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilityFontNameKey

Required key for font name

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilityFontFamilyKey

Optional key for font family

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilityVisibleNameKey

Optional key for font visibility

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilityFontSizeKey

Required key for font size

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

#### Declared In

NSAccessibility.h

## Window-specific attributes

The following are attributes specific to windows:

```
NSString *const NSAccessibilityCancelButtonAttribute;
NSString *const NSAccessibilityCloseButtonAttribute;
NSString *const NSAccessibilityDefaultButtonAttribute;
NSString *const NSAccessibilityGrowAreaAttribute;
NSString *const NSAccessibilityMainAttribute;
NSString *const NSAccessibilityMinimizeButtonAttribute;
NSString *const NSAccessibilityMinimizedAttribute;
NSString *const NSAccessibilityModalAttribute;
NSString *const NSAccessibilityProxyAttribute;
NSString *const NSAccessibilityToolbarButtonAttribute;
NSString *const NSAccessibilityZoomButtonAttribute;
```

#### Constants

NSAccessibilityCloseButtonAttribute

Element for close button (id)

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityGrowAreaAttribute

Element for grow area (id)

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityModalAttribute

Element is the window modal (NSNumber)

Available in Mac OS X v10.3 and later.

Declared in NSAccessibility.h.

NSAccessibilityDefaultButtonAttribute

Element for default button (id)

Available in Mac OS X v10.3 and later.

Declared in NSAccessibility.h.

NSAccessibilityCancelButtonAttribute

Element for cancel button (id)

Available in Mac OS X v10.3 and later.

Declared in NSAccessibility.h.

NSAccessibilityMainAttribute

Flag indicating whether a window is the main window (NSNumber)

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityMinimizeButtonAttribute

Element for minimize button (id)

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityMinimizedAttribute

Flag indicating whether a window is minimized (NSNumber)

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityToolbarButtonAttribute

Element for toolbar toggle button (id)

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityProxyAttribute

Element for title's icon (id)

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityZoomButtonAttribute

Element for zoom button (id)

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

#### **Declared In**

NSAccessibility.h

## Orientations

`NSAccessibility` defines the following values to indicate the orientation of elements, such as scroll bars and split views. One of these values is returned as the value for an object's `NSAccessibilityOrientationAttribute`.

```
NSString *const NSAccessibilityHorizontalOrientationValue;
NSString *const NSAccessibilityVerticalOrientationValue;
```

### Constants

`NSAccessibilityHorizontalOrientationValue`

Element is oriented horizontally

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityVerticalOrientationValue`

Element is oriented vertically

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

## Application-specific attributes

The following are attributes specific to the application object.

```
NSString *const NSAccessibilityClearButtonAttribute;
NSString *const NSAccessibilityColumnTitlesAttribute;
NSString *const NSAccessibilityFocusedUIElementAttribute;
NSString *const NSAccessibilityFocusedWindowAttribute;
NSString *const NSAccessibilityFrontmostAttribute;
NSString *const NSAccessibilityHiddenAttribute;
NSString *const NSAccessibilityMainWindowAttribute;
NSString *const NSAccessibilityMenuBarAttribute;
NSString *const NSAccessibilityOrientationAttribute;
NSString *const NSAccessibilitySearchButtonAttribute;
NSString *const NSAccessibilitySearchMenuAttribute;
NSString *const NSAccessibilityWindowsAttribute;
```

### Constants

`NSAccessibilityFocusedUIElementAttribute`

Element with the current focus (id)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityFocusedWindowAttribute`

Application's window with current focus (id)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityFrontmostAttribute`

Flag indicating whether application is in front (NSNumber)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityHiddenAttribute`

Flag indicating whether application is hidden (NSNumber)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityMainWindowAttribute`

Application's main window (id)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityMenuBarAttribute`

Application's menu bar (id)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityWindowsAttribute`

Application's windows (NSArray)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

#### Declared In

`NSAccessibility.h`

## Grid view attributes

The following attributes are used with grid views, which are user interfaces like thumbnails and media browsers that present a grid of items. The children of a grid are ordered.

```
NSString *const NSAccessibilityColumnCountAttribute;
NSString *const NSAccessibilityOrderedByRowAttribute;
NSString *const NSAccessibilityRowCountAttribute;
```

#### Constants

`NSAccessibilityColumnCountAttribute`

Number of columns in grid (NSNumber as intValue)

Available in Mac OS X v10.5 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityOrderedByRowAttribute`

Whether grid is ordered row major if YES, column major if NO (NSNumber as boolValue)

Available in Mac OS X v10.5 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityRowCountAttribute`

Number of rows in grid (NSNumber as intValue)

Available in Mac OS X v10.5 and later.

Declared in `NSAccessibility.h`.

#### Declared In

`NSAccessibility.h`

## Table view and outline view attributes

The following are attributes specific to tables and outlines.

```
NSString *const NSAccessibilityColumnsAttribute;
NSString *const NSAccessibilityRowsAttribute;
NSString *const NSAccessibilitySelectedColumnsAttribute;
NSString *const NSAccessibilitySelectedRowsAttribute;
NSString *const NSAccessibilitySortDirectionAttribute;
NSString *const NSAccessibilityVisibleColumnsAttribute;
NSString *const NSAccessibilityVisibleRowsAttribute;
```

### Constants

`NSAccessibilityColumnsAttribute`

Table's columns (NSArray)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityRowsAttribute`

Table's rows (NSArray)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilitySelectedColumnsAttribute`

Table's selected columns (NSArray)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilitySelectedRowsAttribute`

Table's selected rows (NSArray)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilitySortDirectionAttribute`

Column's sort direction (NSString). See [“Column sort direction”](#) (page 3440).

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityVisibleColumnsAttribute`

Table's visible columns (NSArray)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityVisibleRowsAttribute`

Table's visible rows (NSArray)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

### Declared In

`NSAccessibility.h`

## Outline view attributes

These attributes are used in outline views.

```
NSString *const NSAccessibilityDisclosedByRowAttribute;
NSString *const NSAccessibilityDisclosedRowsAttribute;
NSString *const NSAccessibilityDisclosingAttribute;
NSString *const NSAccessibilityDisclosureLevelAttribute;
```

### Constants

`NSAccessibilityDisclosedByRowAttribute`

Row disclosing this row (id)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityDisclosedRowsAttribute`

Rows disclosed by this row (NSArray)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityDisclosingAttribute`

Flag indicating whether a row is disclosing other rows (NSNumber)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityDisclosureLevelAttribute`

Indentation level of this row (NSNumber)

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.

### Declared In

`NSAccessibility.h`

## Column sort direction

`NSAccessibility` defines the following values for `NSAccessibilitySortDirectionAttribute` to indicate the sort direction of a column.

```
NSString *const NSAccessibilityAscendingSortDirectionValue;
NSString *const NSAccessibilityDescendingSortDirectionValue;
NSString *const NSAccessibilityUnknownSortDirectionValue;
```

### Constants

`NSAccessibilityAscendingSortDirectionValue`

Column sorted in ascending values

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityDescendingSortDirectionValue`

Column sorted in descending values

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.

NSAccessibilityUnknownSortDirectionValue

Sort direction unknown

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

#### Declared In

NSAccessibility.h

## Slider attributes

The following attributes are specific to sliders.

```
NSString *const NSAccessibilityAllowedValuesAttribute;
NSString *const NSAccessibilityLabelUIElementsAttribute;
NSString *const NSAccessibilityLabelValueAttribute;
```

#### Constants

NSAccessibilityAllowedValuesAttribute

Array of allowed values (NSArray)

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilityLabelUIElementsAttribute

Array of label elements (NSArray)

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilityLabelValueAttribute

Value of label element (NSNumber)

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

#### Declared In

NSAccessibility.h

## Screen matte attributes

The following attributes are specific to screen mattes.

```
NSString *const NSAccessibilityMatteContentUIElementAttribute;
NSString *const NSAccessibilityMatteHoleAttribute;
```

#### Constants

NSAccessibilityMatteHoleAttribute

Bounds of matte hole in screen coordinates (NSValue containing an NSRect)

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilityMatteContentUIElementAttribute

Element clipped by the matte (id)

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

**Declared In**

NSAccessibility.h

**Ruler view attributes**

The following attributes are specific to ruler views.

```
NSString *const NSAccessibilityMarkerGroupUIElementAttribute;
NSString *const NSAccessibilityMarkerTypeAttribute;
NSString *const NSAccessibilityMarkerTypeDescriptionAttribute;
NSString *const NSAccessibilityMarkerUIElementsAttribute;
NSString *const NSAccessibilityMarkerValuesAttribute;
NSString *const NSAccessibilityUnitDescriptionAttribute;
NSString *const NSAccessibilityUnitsAttribute;
```

**Constants**

NSAccessibilityMarkerGroupUIElementAttribute

**Marker group user interface element (id)**

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilityMarkerTypeAttribute

**Type of marker (NSString).** See [“Ruler marker type values”](#) (page 3443).

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilityMarkerTypeDescriptionAttribute

**Description of marker type (NSString)**

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilityMarkerUIElementsAttribute

**Array of marker user interface elements (NSArray)**

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilityMarkerValuesAttribute

**Marker values**

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilityUnitDescriptionAttribute

**Description of ruler units (NSString)**

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilityUnitsAttribute

**Ruler units (NSString).** See [“Ruler unit attributes”](#) (page 3444).

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

**Declared In**

NSAccessibility.h

## Ruler marker type values

NSAccessibility defines the following values for `NSAccessibilityMarkerTypeAttribute` to indicate the marker type of an element:

```
NSString *const NSAccessibilityCenterTabStopMarkerTypeValue;
NSString *const NSAccessibilityDecimalTabStopMarkerTypeValue;
NSString *const NSAccessibilityFirstLineIndentMarkerTypeValue;
NSString *const NSAccessibilityHeadIndentMarkerTypeValue;
NSString *const NSAccessibilityLeftTabStopMarkerTypeValue;
NSString *const NSAccessibilityRightTabStopMarkerTypeValue;
NSString *const NSAccessibilityTailIndentMarkerTypeValue;
NSString *const NSAccessibilityUnknownMarkerTypeValue;
```

### Constants

`NSAccessibilityLeftTabStopMarkerTypeValue`

**Left tab stop**

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityRightTabStopMarkerTypeValue`

**Right tab stop**

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityCenterTabStopMarkerTypeValue`

**Center tab stop**

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityDecimalTabStopMarkerTypeValue`

**Decimal tab stop**

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityHeadIndentMarkerTypeValue`

**Head indent marker**

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityTailIndentMarkerTypeValue`

**Tail indent marker**

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityFirstLineIndentMarkerTypeValue`

**First line indent marker**

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityUnknownMarkerTypeValue`

**Unknown marker type**

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.

**Declared In**

NSAccessibility.h

**Ruler unit attributes**

NSAccessibility defines the following values for `NSAccessibilityUnitsAttribute` to indicate the unit values of the ruler.

```
NSString *const NSAccessibilityCentimetersUnitValue;
NSString *const NSAccessibilityInchesUnitValue;
NSString *const NSAccessibilityPicasUnitValue;
NSString *const NSAccessibilityPointsUnitValue;
NSString *const NSAccessibilityUnknownUnitValue;
```

**Constants**`NSAccessibilityInchesUnitValue`

Ruler units are inches.

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.`NSAccessibilityCentimetersUnitValue`

Ruler units are centimeters.

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.`NSAccessibilityPointsUnitValue`

Ruler units are points.

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.`NSAccessibilityPicasUnitValue`

Ruler units are picas.

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.`NSAccessibilityUnknownUnitValue`

Ruler units are unknown.

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.**Declared In**

NSAccessibility.h

**Linkage elements**

These constants define link attributes.

```
NSString *const NSAccessibilityLinkedUIElementsAttribute;
NSString *const NSAccessibilityServesAsTitleForUIElementsAttribute;
NSString *const NSAccessibilityTitleUIElementAttribute;
```

**Constants**

`NSAccessibilityLinkedUIElementsAttribute`  
 Elements corresponding to each other (NSArray)

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityTitleUIElementAttribute`  
 Element's title element (id)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityServesAsTitleForUIElementsAttribute`  
 Elements to which title applies (NSArray)

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.

**Declared In**

`NSAccessibility.h`

**Miscellaneous attributes**

The following are miscellaneous attributes.

```
NSString *const NSAccessibilityDecrementButtonAttribute;
NSString *const NSAccessibilityDocumentAttribute;
NSString *const NSAccessibilityEditedAttribute;
NSString *const NSAccessibilityExpandedAttribute;
NSString *const NSAccessibilityFilenameAttribute;
NSString *const NSAccessibilityHeaderAttribute;
NSString *const NSAccessibilityHorizontalScrollBarAttribute;
NSString *const NSAccessibilityIncrementButtonAttribute;
NSString *const NSAccessibilityIndexAttribute;
NSString *const NSAccessibilityNextContentsAttribute;
NSString *const NSAccessibilityOverflowButtonAttribute;
NSString *const NSAccessibilityPreviousContentsAttribute;
NSString *const NSAccessibilitySelectedAttribute;
NSString *const NSAccessibilitySplittersAttribute;
NSString *const NSAccessibilityTabsAttribute;
NSString *const NSAccessibilityURLAttribute;
NSString *const NSAccessibilityVerticalScrollBarAttribute;
```

**Constants**

`NSAccessibilityClearButtonAttribute`  
 Search field clear button (id)

Available in Mac OS X v10.3 and later.

Declared in `NSAccessibility.h`.

- `NSAccessibilityColumnTitlesAttribute`  
Elements for column titles (NSArray)  
Available in Mac OS X v10.2 and later.  
Declared in `NSAccessibility.h`.
- `NSAccessibilityDecrementButtonAttribute`  
Stepper's decrement button (id)  
Available in Mac OS X v10.2 and later.  
Declared in `NSAccessibility.h`.
- `NSAccessibilityDocumentAttribute`  
URL for the file represented by the element (NSString)  
Available in Mac OS X v10.2 and later.  
Declared in `NSAccessibility.h`.
- `NSAccessibilityEditedAttribute`  
Flag indicating whether element has been modified (NSNumber)  
Available in Mac OS X v10.2 and later.  
Declared in `NSAccessibility.h`.
- `NSAccessibilityExpandedAttribute`  
Flag indicating whether element is expanded (NSNumber)  
Available in Mac OS X v10.2 and later.  
Declared in `NSAccessibility.h`.
- `NSAccessibilityFilenameAttribute`  
Filename associated with element (NSString)  
Available in Mac OS X v10.2 and later.  
Declared in `NSAccessibility.h`.
- `NSAccessibilityHeaderAttribute`  
Table view's header element (id)  
Available in Mac OS X v10.2 and later.  
Declared in `NSAccessibility.h`.
- `NSAccessibilityHorizontalScrollBarAttribute`  
Scroll view's horizontal scroll bar (id)  
Available in Mac OS X v10.2 and later.  
Declared in `NSAccessibility.h`.
- `NSAccessibilityIncrementButtonAttribute`  
Stepper's increment button (id)  
Available in Mac OS X v10.2 and later.  
Declared in `NSAccessibility.h`.
- `NSAccessibilityIndexAttribute`  
Index of element (NSNumber)  
Available in Mac OS X v10.4 and later.  
Declared in `NSAccessibility.h`.

`NSAccessibilityNextContentsAttribute`

Contents following current divider element, such as a subview adjacent to a split view's splitter element (NSArray)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityOrientationAttribute`

Element's orientation, which can have the value `NSAccessibilityHorizontalOrientationValue` or `NSAccessibilityVerticalOrientationValue`

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityOverflowButtonAttribute`

Toolbar's overflow button (id)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityPreviousContentsAttribute`

Contents preceding current divider element, such as a subview adjacent to a split view's splitter bar element (NSArray)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilitySearchButtonAttribute`

Search field search button (id)

Available in Mac OS X v10.3 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilitySearchMenuAttribute`

Search field menu (id)

Available in Mac OS X v10.3 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilitySelectedAttribute`

Flag indicating whether element is selected (NSNumber)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilitySplittersAttribute`

Splitter bar elements in a split view (NSArray)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityTabsAttribute`

Tab view's tab elements (NSArray)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityURLAttribute`

URL associated with element (NSURL)

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityVerticalScrollBarAttribute`

Scroll view's vertical scroll bar (id)

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

**Declared In**

`NSAccessibility.h`

## Roles

These constants define standard roles that identify the type of object an accessibility object represents. One of these values is returned as the value for an object's `NSAccessibilityRoleAttribute`.

```

NSString *const NSAccessibilityApplicationRole;
NSString *const NSAccessibilityBrowserRole;
NSString *const NSAccessibilityBusyIndicatorRole;
NSString *const NSAccessibilityButtonRole;
NSString *const NSAccessibilityCheckBoxRole;
NSString *const NSAccessibilityColorWellRole;
NSString *const NSAccessibilityColumnRole;
NSString *const NSAccessibilityComboBoxRole;
NSString *const NSAccessibilityDisclosureTriangleRole;
NSString *const NSAccessibilityDrawerRole;
NSString *const NSAccessibilityGridRole;
NSString *const NSAccessibilityGroupRole;
NSString *const NSAccessibilityGrowAreaRole;
NSString *const NSAccessibilityHelpTagRole;
NSString *const NSAccessibilityImageRole;
NSString *const NSAccessibilityIncrementorRole;
NSString *const NSAccessibilityLinkRole;
NSString *const NSAccessibilityListRole;
NSString *const NSAccessibilityMatteRole;
NSString *const NSAccessibilityMenuBarRole;
NSString *const NSAccessibilityMenuButtonRole;
NSString *const NSAccessibilityMenuItemRole;
NSString *const NSAccessibilityMenuRole;
NSString *const NSAccessibilityOutlineRole;
NSString *const NSAccessibilityPopUpButtonRole;
NSString *const NSAccessibilityProgressIndicatorRole;
NSString *const NSAccessibilityRadioButtonRole;
NSString *const NSAccessibilityRadioGroupRole;
NSString *const NSAccessibilityRowRole;
NSString *const NSAccessibilityRulerMarkerRole;
NSString *const NSAccessibilityRulerRole;
NSString *const NSAccessibilityScrollAreaRole;
NSString *const NSAccessibilityScrollBarRole;
NSString *const NSAccessibilitySheetRole;
NSString *const NSAccessibilitySliderRole;
NSString *const NSAccessibilitySortButtonRole;
NSString *const NSAccessibilitySplitGroupRole;
NSString *const NSAccessibilitySplitterRole;
NSString *const NSAccessibilityStaticTextRole;
NSString *const NSAccessibilitySystemWideRole;
NSString *const NSAccessibilityTabGroupRole;
NSString *const NSAccessibilityTableRole;
NSString *const NSAccessibilityTextAreaRole;
NSString *const NSAccessibilityTextFieldRole;
NSString *const NSAccessibilityToolbarRole;
NSString *const NSAccessibilityUnknownRole;
NSString *const NSAccessibilityValueIndicatorRole;
NSString *const NSAccessibilityWindowRole;

```

### Constants

NSAccessibilityApplicationRole

#### Application

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityBrowserRole

Browser

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityBusyIndicatorRole

Busy indicator

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityCheckBoxRole

Checkbox

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityColorWellRole

Color well

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityColumnRole

Column

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityComboBoxRole

Combo box

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityDisclosureTriangleRole

Disclosure triangle

Available in Mac OS X v10.5 and later.

Declared in NSAccessibility.h.

NSAccessibilityDrawerRole

Drawer

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityGridRole

Grid

Available in Mac OS X v10.5 and later.

Declared in NSAccessibility.h.

NSAccessibilityGroupRole

Group

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

- `NSAccessibilityGrowAreaRole`  
Window's grow (resize) area  
Available in Mac OS X v10.2 and later.  
Declared in `NSAccessibility.h`.
- `NSAccessibilityHelpTagRole`  
Help tag  
Available in Mac OS X v10.4 and later.  
Declared in `NSAccessibility.h`.
- `NSAccessibilityImageRole`  
Image  
Available in Mac OS X v10.2 and later.  
Declared in `NSAccessibility.h`.
- `NSAccessibilityIncrementorRole`  
Stepper  
Available in Mac OS X v10.2 and later.  
Declared in `NSAccessibility.h`.
- `NSAccessibilityLinkRole`  
Link  
Available in Mac OS X v10.4 and later.  
Declared in `NSAccessibility.h`.
- `NSAccessibilityListRole`  
List  
Available in Mac OS X v10.2 and later.  
Declared in `NSAccessibility.h`.
- `NSAccessibilityMatteRole`  
Matte  
Available in Mac OS X v10.4 and later.  
Declared in `NSAccessibility.h`.
- `NSAccessibilityMenuBarRole`  
Menu bar  
Available in Mac OS X v10.2 and later.  
Declared in `NSAccessibility.h`.
- `NSAccessibilityMenuButtonRole`  
Menu button  
Available in Mac OS X v10.2 and later.  
Declared in `NSAccessibility.h`.
- `NSAccessibilityMenuItemRole`  
Menu item  
Available in Mac OS X v10.2 and later.  
Declared in `NSAccessibility.h`.

NSAccessibilityMenuRole

**Menu**

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

NSAccessibilityOutlineRole

**Outline**

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

NSAccessibilityPopUpButtonRole

**Pop-up button**

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

NSAccessibilityProgressIndicatorRole

**Progress indicator**

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

NSAccessibilityButtonRole

**Button**

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

NSAccessibilityRadioButtonRole

**Radio button**

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

NSAccessibilityRadioGroupRole

**Radio group**

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

NSAccessibilityRowRole

**Row**

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

NSAccessibilityRulerRole

**Ruler**

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.

NSAccessibilityRulerMarkerRole

**Ruler marker**

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.

NSAccessibilityScrollAreaRole

Scroll view

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

NSAccessibilityScrollBarRole

Scroll bar

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

NSAccessibilitySheetRole

Sheet

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

NSAccessibilitySliderRole

Slider

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

NSAccessibilitySortButtonRole

Sort button

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.

NSAccessibilitySplitGroupRole

Split view

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

NSAccessibilitySplitterRole

Splitter bar of a split view

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

NSAccessibilityStaticTextRole

Uneditable text

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

NSAccessibilitySystemWideRole

Special system-wide element

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

NSAccessibilityTabGroupRole

Tab group

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

NSAccessibilityTableRole

Table

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityTextAreaRole

Text view

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityTextFieldRole

Text field

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityToolbarRole

Toolbar

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityUnknownRole

Unknown object type

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityValueIndicatorRole

Value indicator

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityWindowRole

Window

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

**Declared In**

NSAccessibility.h

## Subroles

These constants define the sub-roles that identify a specialized type of object an accessibility object represents. One of these values is returned as the value for an object's `NSAccessibilitySubroleAttribute`.

```

NSString *const NSAccessibilityCloseButtonSubrole;
NSString *const NSAccessibilityDecrementArrowSubrole;
NSString *const NSAccessibilityDecrementPageSubrole;
NSString *const NSAccessibilityDialogSubrole;
NSString *const NSAccessibilityFloatingWindowSubrole;
NSString *const NSAccessibilityIncrementArrowSubrole;
NSString *const NSAccessibilityIncrementPageSubrole;
NSString *const NSAccessibilityMinimizeButtonSubrole;
NSString *const NSAccessibilityOutlineRowSubrole;
NSString *const NSAccessibilitySearchFieldSubrole;
NSString *const NSAccessibilitySecureTextFieldSubrole;
NSString *const NSAccessibilityStandardWindowSubrole;
NSString *const NSAccessibilitySystemDialogSubrole;
NSString *const NSAccessibilitySystemFloatingWindowSubrole;
NSString *const NSAccessibilityTableRowSubrole;
NSString *const NSAccessibilityTextAttachmentSubrole;
NSString *const NSAccessibilityTextLinkSubrole;
NSString *const NSAccessibilityTimelineSubrole;
NSString *const NSAccessibilityToolbarButtonSubrole;
NSString *const NSAccessibilityUnknownSubrole;
NSString *const NSAccessibilityZoomButtonSubrole;

```

**Constants**

NSAccessibilityCloseButtonSubrole

**Window's close button**

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityDecrementArrowSubrole

**Decrement arrow**

Available in Mac OS X v10.3 and later.

Declared in NSAccessibility.h.

NSAccessibilityDecrementPageSubrole

**Decrement page**

Available in Mac OS X v10.3 and later.

Declared in NSAccessibility.h.

NSAccessibilityDialogSubrole

**Dialog**

Available in Mac OS X v10.3 and later.

Declared in NSAccessibility.h.

NSAccessibilityFloatingWindowSubrole

**Floating window**

Available in Mac OS X v10.3 and later.

Declared in NSAccessibility.h.

NSAccessibilityIncrementArrowSubrole

**Increment arrow**

Available in Mac OS X v10.3 and later.

Declared in NSAccessibility.h.

- `NSAccessibilityIncrementPageSubrole`  
**Increment page**  
Available in Mac OS X v10.3 and later.  
Declared in `NSAccessibility.h`.
- `NSAccessibilityMinimizeButtonSubrole`  
**Window's minimize button**  
Available in Mac OS X v10.2 and later.  
Declared in `NSAccessibility.h`.
- `NSAccessibilityOutlineRowSubrole`  
**Outline row**  
Available in Mac OS X v10.2 and later.  
Declared in `NSAccessibility.h`.
- `NSAccessibilitySearchFieldSubrole`  
**Search field**  
Available in Mac OS X v10.3 and later.  
Declared in `NSAccessibility.h`.
- `NSAccessibilitySecureTextFieldSubrole`  
**Secure text field**  
Available in Mac OS X v10.2 and later.  
Declared in `NSAccessibility.h`.
- `NSAccessibilityStandardWindowSubrole`  
**Standard window**  
Available in Mac OS X v10.3 and later.  
Declared in `NSAccessibility.h`.
- `NSAccessibilitySystemDialogSubrole`  
**System dialog**  
Available in Mac OS X v10.3 and later.  
Declared in `NSAccessibility.h`.
- `NSAccessibilitySystemFloatingWindowSubrole`  
**System floating window**  
Available in Mac OS X v10.3 and later.  
Declared in `NSAccessibility.h`.
- `NSAccessibilityTableRowSubrole`  
**Table row**  
Available in Mac OS X v10.2 and later.  
Declared in `NSAccessibility.h`.
- `NSAccessibilityTextAttachmentSubrole`  
**Text attachment**  
Available in Mac OS X v10.4 and later.  
Declared in `NSAccessibility.h`.

NSAccessibilityTextLinkSubrole

Text link

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilityTimelineSubrole

Timeline

Available in Mac OS X v10.5 and later.

Declared in NSAccessibility.h.

NSAccessibilityToolbarButtonSubrole

Window's toolbar toggle button

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityUnknownSubrole

Unknown subrole

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityZoomButtonSubrole

Window's zoom button

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

#### Declared In

## Action values

These constants define standard actions that accessibility objects can perform.

```
NSString *const NSAccessibilityCancelAction;
NSString *const NSAccessibilityConfirmAction;
NSString *const NSAccessibilityDecrementAction;
NSString *const NSAccessibilityDeleteAction;
NSString *const NSAccessibilityIncrementAction;
NSString *const NSAccessibilityPickAction;
NSString *const NSAccessibilityPressAction;
NSString *const NSAccessibilityRaiseAction;
NSString *const NSAccessibilityShowMenuAction;
```

#### Constants

NSAccessibilityConfirmAction

Simulates pressing Return in object, such as a text field.

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityDecrementAction

Decrements the value of object.

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

`NSAccessibilityDeleteAction`

Deletes the value of object.

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityIncrementAction`

Increments the value of object.

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityPickAction`

Selects the object, such as a menu item.

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityPressAction`

Simulates clicking an object, such as a button.

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityCancelAction`

Cancels the operation.

Available in Mac OS X v10.3 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityRaiseAction`

Simulates bringing a window forward by clicking on its title bar.

Available in Mac OS X v10.3 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityShowMenuAction`

Simulates showing a menu by clicking on it.

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.

**Declared In**

`NSAccessibility.h`

## Focus-change notifications

`NSAccessibility` defines the following notifications, which are sent to observing assistive applications when focus-change events occur. The notifications are sent using the `NSAccessibilityPostNotification` function instead of an `NSNotificationCenter` object.

```
NSString *const NSAccessibilityMainWindowChangedNotification;
NSString *const NSAccessibilityFocusedWindowChangedNotification;
NSString *const NSAccessibilityFocusedUIElementChangedNotification;
```

**Constants**

`NSAccessibilityMainWindowChangedNotification`

Main window has changed.

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityFocusedWindowChangedNotification`

Key window has changed.

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityFocusedUIElementChangedNotification`

Element has gained focus.

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

**Declared In**

`NSAccessibility.h`

**Window-change notifications**

`NSAccessibility` defines the following notifications, which are sent to observing assistive applications when window-change events occur. The notifications are sent using the `NSAccessibilityPostNotification` function instead of an `NSNotificationCenter` object.

```
NSString *const NSAccessibilityWindowCreatedNotification;
NSString *const NSAccessibilityWindowDeminiaturizedNotification;
NSString *const NSAccessibilityWindowMiniaturizedNotification;
NSString *const NSAccessibilityWindowMovedNotification;
NSString *const NSAccessibilityWindowResizedNotification;
```

**Constants**

`NSAccessibilityWindowCreatedNotification`

A new window has appeared.

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityWindowDeminiaturizedNotification`

Window has been restored to full size from the Dock.

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityWindowMiniaturizedNotification`

Window has been put in the Dock.

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

NSAccessibilityWindowMovedNotification

Window has moved.

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityWindowResizedNotification

Window has changed size.

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

#### Declared In

NSAccessibility.h

## Application notifications

NSAccessibility defines the following notifications, which are sent to observing assistive applications when application events occur. The notifications are sent using the `NSAccessibilityPostNotification` function instead of an `NSNotificationCenter` object.

```
NSString *const NSAccessibilityApplicationActivatedNotification;
NSString *const NSAccessibilityApplicationDeactivatedNotification;
NSString *const NSAccessibilityApplicationHiddenNotification;
NSString *const NSAccessibilityApplicationShownNotification;
```

#### Constants

NSAccessibilityApplicationActivatedNotification

Application has activated.

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityApplicationDeactivatedNotification

Application has deactivated.

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityApplicationHiddenNotification

Application has been hidden.

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityApplicationShownNotification

Application has been shown.

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

#### Declared In

NSAccessibility.h

## Drawer and sheet notifications

`NSAccessibility` defines the following notifications, which are sent to observing assistive applications when drawer and sheet events occur. The notifications are sent using the `NSAccessibilityPostNotification` function instead of an `NSNotificationCenter` object.

```
NSString *const NSAccessibilityDrawerCreatedNotification;
NSString *const NSAccessibilitySheetCreatedNotification;
```

### Constants

`NSAccessibilityDrawerCreatedNotification`

A drawer has appeared.

Available in Mac OS X v10.3 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilitySheetCreatedNotification`

A sheet has appeared.

Available in Mac OS X v10.3 and later.

Declared in `NSAccessibility.h`.

### Declared In

`NSAccessibility.h`

## Element notifications

`NSAccessibility` defines the following notifications, which are sent to observing assistive applications when certain events occur. The notifications are sent using the `NSAccessibilityPostNotification` function instead of an `NSNotificationCenter` object.

```
NSString *const NSAccessibilityCreatedNotification;
NSString *const NSAccessibilityMovedNotification;
NSString *const NSAccessibilityResizedNotification;
NSString *const NSAccessibilityTitleChangedNotification;
NSString *const NSAccessibilityUIElementDestroyedNotification;
NSString *const NSAccessibilityValueChangedNotification;
```

### Constants

`NSAccessibilityCreatedNotification`

Element has been created.

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityMovedNotification`

Element has been moved.

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilityResizedNotification`

Element has been resized.

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.

NSAccessibilityTitleChangedNotification

Title has changed.

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilityUIElementDestroyedNotification

Element has been destroyed.

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

NSAccessibilityValueChangedNotification

Element's value has changed.

Available in Mac OS X v10.2 and later.

Declared in NSAccessibility.h.

#### Declared In

NSAccessibility.h

## Miscellaneous notifications

NSAccessibility defines the following notifications, which are sent to observing assistive applications when certain events occur. The notifications are sent using the `NSAccessibilityPostNotification` function instead of an `NSNotificationCenter` object.

```
NSString *const NSAccessibilityHelpTagCreatedNotification;
NSString *const NSAccessibilityRowCountChangedNotification;
NSString *const NSAccessibilitySelectedChildrenChangedNotification;
NSString *const NSAccessibilitySelectedColumnsChangedNotification;
NSString *const NSAccessibilitySelectedRowsChangedNotification;
NSString *const NSAccessibilitySelectedTextChangedNotification;
```

#### Constants

NSAccessibilityHelpTagCreatedNotification

A help tag has appeared.

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilityRowCountChangedNotification

A row has been added or deleted.

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilitySelectedChildrenChangedNotification

Selected child elements have changed.

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

NSAccessibilitySelectedColumnsChangedNotification

Selected columns have changed.

Available in Mac OS X v10.4 and later.

Declared in NSAccessibility.h.

`NSAccessibilitySelectedRowsChangedNotification`

Selected rows have changed.

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.

`NSAccessibilitySelectedTextChangedNotification`

Selected text has changed.

Available in Mac OS X v10.4 and later.

Declared in `NSAccessibility.h`.

**Declared In**

`NSAccessibility.h`

## UserInfo key for error codes in accessibility exceptions

This is a key used by the `userInfo` dictionary of an `NSAccessibilityException`.

```
NSString *const NSAccessibilityErrorCodeExceptionInfo;
```

**Constants**

`NSAccessibilityErrorCodeExceptionInfo`

Integer error code used for debugging (as an `NSNumber`).

Available in Mac OS X v10.2 and later.

Declared in `NSAccessibility.h`.

**Declared In**

`NSAccessibility.h`

# NSAnimatablePropertyContainer Protocol Reference

---

|                     |                                             |
|---------------------|---------------------------------------------|
| <b>Adopted by</b>   | NSWindow<br>NSView                          |
| <b>Framework</b>    | /System/Library/Frameworks/AppKit.framework |
| <b>Availability</b> | Available in Mac OS X v10.5 and later.      |
| <b>Declared in</b>  | AppKit/NSAnimation.h                        |

## Overview

The `NSAnimatablePropertyContainer` protocol defines a way to add animation to an existing class with a minimum of API impact. It returns a proxy object for the receiver that can be used to initiate implied animation of property changes. An object's animator proxy should be treated as if it was the object itself, and may be passed to any code that accepts the object as a parameter. Sending of key-value-coding compliant "set" messages to the proxy will trigger animation for automatically animated properties of its target object.

An object's automatically animated properties are those for which `NSAnimatablePropertyContainer` (page 3465) finds and returns an `CAAnimation` instead of nil, often because `animator` (page 3468) specifies a default animation for the key.

It's perfectly valid to set a new value for a property for which an animation that is currently in progress; this simply sets a new target value for that property, with animation to the new target proceeding from whatever current value the property has reached. An in-flight property animation can be stopped by setting a new value for the property bracketed by an `NSAnimationContext` with 0.0 as the duration.

## Tasks

### Getting the Animator Proxy

- `animator` (page 3468)

Returns a proxy object for the receiver that can be used to initiate implied animation for property changes.

## Managing Animations for Properties

- [animations](#) (page 3467)  
Returns the optional dictionary that maps event trigger keys to animation objects.
- [setAnimations:](#) (page 3468)  
Sets the option dictionary that maps event trigger keys to animation objects.
- [animationForKey:](#) (page 3467)  
Returns the animation that should be performed for the specified key.
- + [defaultAnimationForKey:](#) (page 3466)  
Returns the default animation that should be performed for the specified key.

## Class Methods

### defaultAnimationForKey:

Returns the default animation that should be performed for the specified key.

```
+ (id)defaultAnimationForKey:(NSString *)key
```

#### Parameters

*key*

The action name or property specified as a string.

#### Return Value

The animation to perform. A subclass of `CAAnimation`.

#### Discussion

The [NSAnimatablePropertyContainer](#) (page 3465) method consults this class method when its search of the receivers “[Getting the Animator Proxy](#)” (page 3465) dictionary fails to return an animation for *key*.

An animatable property container should implement this method to return a default animation to be performed for each key that it wants to make auto-animatable, where *key* usually references a property of the receiver, but can also specify a special animation trigger ([NSAnimationTriggerOrderIn](#) (page 3469) or [NSAnimationTriggerOrderOut](#) (page 3469)).

A developer implementing a custom view subclass, can enable automatic animation for properties by overriding this method, and having it return the desired default `CAAnimation` subclass to use for each of the property keys of interest. The override should defer to super for any keys it doesn't specifically handle, facilitating inheritance of default animation specifications. The following is an example of such an implementation.

```
@implementation MyView
+ (id)defaultAnimationForKey:(NSString *)key {
 if ([key isEqualToString:@"borderColor"]) {
 // By default, animate border color changes with simple linear
 interpolation to the new color value.
 return [CABasicAnimation animation];
 } else {
 // Defer to super's implementation for any keys we don't specifically
 handle.
 }
}
```

```

 return [super defaultAnimationForKey:key];
 }
}
@end

```

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSAnimation.h

## Instance Methods

### animationForKey:

Returns the animation that should be performed for the specified key.

- (id)animationForKey:(NSString \*)key

**Parameters**

*key*

The action name or property specified as a string.

**Return Value**

The animation to perform. A subclass of `CAAnimation`.

**Discussion**

When the action specified by *key* is triggered for an object, this method is consulted to find the animation, if any, that should be performed in response.

Like its Core Animation `CALayer` counterpart, `animationForKey:`, this method is a funnel point that defines the order in which the search for an animation proceeds. It first checks the receiver's “[Getting the Animator Proxy](#)” (page 3465) dictionary for a value matching *key*, then falls back to [animator](#) (page 3468) for the receiver's class.

Subclasses should not typically need to override this method.

**Availability**

Available in Mac OS X v10.5 and later.

**See Also**

- [animator](#) (page 3468)

“[Managing Animations for Properties](#)” (page 3466)

“[Getting the Animator Proxy](#)” (page 3465)

**Declared In**

NSAnimation.h

### animations

Returns the optional dictionary that maps event trigger keys to animation objects.

```
- (NSDictionary *)animations
```

**Return Value**

The animations as a dictionary.

**Discussion**

When an action occurs that may trigger an animation the [NSAnimatablePropertyContainer](#) (page 3465) method first looks in this dictionary for an animation that matches the key. Typically, the key will name a property of the object whose value has just changed, but it may specify a special event trigger ([NSAnimationTriggerOrderIn](#) (page 3469) or [NSAnimationTriggerOrderOut](#) (page 3469)).

**Availability**

Available in Mac OS X v10.5 and later.

**See Also**

- [animator](#) (page 3468)

“[Managing Animations for Properties](#)” (page 3466)

**Declared In**

`NSAnimation.h`

**animator**

Returns a proxy object for the receiver that can be used to initiate implied animation for property changes.

```
- (id)animator
```

**Return Value**

Returns a proxy object for the receiver that can initiate implied animations in response to property changes.

**Discussion**

The animator proxy object should be treated as if it was the receiver itself, and may be passed to any code that accepts the receiver as a parameter.

Sending key-value coding compliant “set” messages to the proxy will trigger animation for automatically animated properties of its target object, if the active `NSAnimationContext` in the current thread has a duration value greater than zero, and an animation for the property key is found by the [NSAnimatablePropertyContainer](#) (page 3465) search mechanism.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

`NSAnimation.h`

**setAnimations:**

Sets the option dictionary that maps event trigger keys to animation objects.

```
- (void)setAnimations:(NSDictionary *)dict
```

**Parameters***dict*

A dictionary containing the event trigger keys and associated animation objects.

**Availability**

Available in Mac OS X v10.5 and later.

**See Also**

[NSAnimatablePropertyContainer](#) (page 3465)

– [animator](#) (page 3468)

“[Getting the Animator Proxy](#)” (page 3465)

**Declared In**

NSAnimation.h

## Constants

### Transition Animation Keys

The following constants define the keys that reference the transitions used as views are made visible and hidden.

```
NSString *NSAnimationTriggerOrderIn;
NSString *NSAnimationTriggerOrderOut;
```

**Constants**

NSAnimationTriggerOrderIn

The key that references the transition animation used when a view becomes visible, either as a result of being inserted into the visible view hierarchy or as a result of the view no longer being set as hidden

.

Available in Mac OS X v10.5 and later.

Declared in NSAnimation.h.

NSAnimationTriggerOrderOut

The key that references the transition animation used when a view is no longer visible, either as a result of being removed from the visible view hierarchy or as a result of the view set as hidden.

Available in Mac OS X v10.5 and later.

Declared in NSAnimation.h.

# NSChangeSpelling Protocol Reference

|                        |                                             |
|------------------------|---------------------------------------------|
| <b>Adopted by</b>      | NSText                                      |
| <b>Framework</b>       | /System/Library/Frameworks/AppKit.framework |
| <b>Availability</b>    | Available in Mac OS X v10.0 and later.      |
| <b>Declared in</b>     | AppKit/NSSpellProtocol.h                    |
| <b>Companion guide</b> | Spell Checking                              |

## Overview

This protocol is implemented by objects in the responder chain that can correct a misspelled word. See the `NSSpellChecker` class description for more information.

## Tasks

### Changing Spellings

- [changeSpelling:](#) (page 3471)

Replaces the selected word in the receiver with a corrected version from the Spelling panel.

## Instance Methods

### changeSpelling:

Replaces the selected word in the receiver with a corrected version from the Spelling panel.

- (void)changeSpelling:(id)sender

#### Discussion

This message is sent by the `NSSpellChecker` to the object whose text is being checked. To get the corrected spelling, ask *sender* for the string value of its selected cell (visible to the user as the text field in the Spelling panel). This method should replace the selected portion of the text with the string that it gets from the `NSSpellChecker`.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

# NSColorPickingCustom Protocol Reference

---

|                        |                                             |
|------------------------|---------------------------------------------|
| <b>Adopted by</b>      | NSColorPicker                               |
| <b>Conforms to</b>     | NSColorPickingDefault                       |
| <b>Framework</b>       | /System/Library/Frameworks/AppKit.framework |
| <b>Availability</b>    | Available in Mac OS X v10.0 and later.      |
| <b>Declared in</b>     | AppKit/NSColorPicking.h                     |
| <b>Companion guide</b> | Color Programming Topics for Cocoa          |

## Overview

Together with the `NSColorPickingDefault` protocol, `NSColorPickingCustom` provides a way to add color pickers—custom user interfaces for color selection—to an application’s `NSColorPanel` instance. The `NSColorPickingDefault` protocol provides basic behavior for a color picker. The `NSColorPicker` class adopts the `NSColorPickingDefault` protocol.

## Tasks

### Configuring Color Pickers

- [setColor:](#) (page 3475)  
Adjusts the receiver to make the specified color the currently selected color.

### Getting Color Picker Information

- [currentMode](#) (page 3474)  
Returns the receiver’s current mode (or submode, if applicable).
- [supportsMode:](#) (page 3475)  
Returns a Boolean value indicating whether or not the receiver supports the specified picking mode.

## Displaying Color Pickers

- [provideNewView:](#) (page 3474)

Returns the view containing the receiver's user interface.

## Instance Methods

### currentMode

Returns the receiver's current mode (or submode, if applicable).

- (NSColorPanelMode)currentMode

#### Return Value

The current color picker mode. The returned value should be unique to your color picker. See this protocol description's list of the unique values for the standard color pickers used by the Application Kit.

#### Availability

Available in Mac OS X v10.0 and later.

#### See Also

- [supportsMode:](#) (page 3475)

#### Declared In

NSColorPicking.h

### provideNewView:

Returns the view containing the receiver's user interface.

- (NSView \*)provideNewView:(BOOL)initialRequest

#### Parameters

*initialRequest*

YES only when this method is first invoked for your color picker. If *initialRequest* is YES, the method should perform any initialization required (such as lazily loading a nib file, initializing the view, or performing any other custom initialization required for your picker).

#### Return Value

The view containing the color picker's user interface. The *NSView* returned by this method should be set to automatically resize both its width and height.

#### Discussion

This message is sent to the color picker whenever the color panel attempts to display it. This may be when the panel is first presented, when the user switches pickers, or when the picker is switched through an API.

#### Availability

Available in Mac OS X v10.0 and later.

#### Declared In

NSColorPicking.h

## setColor:

Adjusts the receiver to make the specified color the currently selected color.

- (void)setColor:(NSColor \*)*color*

### Parameters

*color*

The color to set as the currently selected color.

### Discussion

This method is invoked on the current color picker each time `NSColorPanel`'s [setColor:](#) (page 729) method is invoked. If *color* is actually different from the color picker's color (as it would be if, for example, the user dragged a color into `NSColorPanel`'s color well), this method could be used to update the color picker's color to reflect the change.

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

`NSColorPicking.h`

## supportsMode:

Returns a Boolean value indicating whether or not the receiver supports the specified picking mode.

- (BOOL)supportsMode:(NSColorPanelMode)*mode*

### Parameters

*mode*

The color picking mode.

### Return Value

YES if the color picker supports the specified color picking mode; otherwise NO.

### Discussion

This method is invoked when the `NSColorPanel` is first initialized: It is used to attempt to restore the user's previously selected mode. It is also invoked by `NSColorPanel`'s [setMode:](#) (page 730) method to find the color picker that supports a particular mode. See this protocol description's list of the unique mode values for the standard color pickers used by the Application Kit.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [currentMode](#) (page 3474)

### Declared In

`NSColorPicking.h`

# NSColorPickingDefault Protocol Reference

---

|                        |                                             |
|------------------------|---------------------------------------------|
| <b>Adopted by</b>      | NSColorPicker                               |
| <b>Framework</b>       | /System/Library/Frameworks/AppKit.framework |
| <b>Availability</b>    | Available in Mac OS X v10.0 and later.      |
| <b>Declared in</b>     | AppKit/NSColorPicking.h                     |
| <b>Companion guide</b> | Color Programming Topics for Cocoa          |

## Overview

The `NSColorPickingDefault` protocol, together with the `NSColorPickingCustom` protocol, provides an interface for adding color pickers—custom user interfaces for color selection—to an application's `NSColorPanel` instance. The `NSColorPickingDefault` protocol provides basic behavior for a color picker. The `NSColorPickingCustom` protocol provides implementation-specific behavior.

## Tasks

### Creating Color Pickers

- `initWithPickerMask:colorPanel:` (page 3480)  
Initializes the receiver with a given color panel and its mode.

### Configuring Color Pickers

- `setMode:` (page 3482)  
Specifies the receiver's mode.
- `insertNewButtonImage:in:` (page 3481)  
Sets the image of a given button cell.
- `provideNewButtonImage` (page 3481)  
Provides the image of the button used to select the receiver in the color panel.
- `minContentSize` (page 3481)  
Indicates the receiver's minimum content size.

- [buttonToolTip](#) (page 3479)  
Provides the toolbar button help tag.

## Handling Events

- [alphaControlAddedOrRemoved](#): (page 3478)  
Sent when the color panel's opacity controls have been hidden or displayed.
- [viewSizeChanged](#): (page 3482)  
Tells the receiver when the color panel's view size changes in a way that might affect the color picker.

## Managing Color Lists

- [attachColorList](#): (page 3478)  
Tells the receiver to attach the given color list, if it isn't already displaying the list.
- [detachColorList](#): (page 3479)  
Tells the receiver to detach the given color list, unless the receiver isn't displaying the list.

## Instance Methods

### **alphaControlAddedOrRemoved:**

Sent when the color panel's opacity controls have been hidden or displayed.

- (void)alphaControlAddedOrRemoved:(id) *sender*

#### **Parameters**

*sender*

The color panel sending the message.

#### **Discussion**

This method is invoked automatically when the opacity slider of the `NSColorPanel` is added or removed; you never invoke this method directly.

If the color picker has its own opacity controls, it should hide or display them, depending on whether the sender's [showsAlpha](#) (page 732) method returns NO or YES.

#### **Availability**

Available in Mac OS X v10.0 and later.

#### **Declared In**

`NSColorPicking.h`

### **attachColorList:**

Tells the receiver to attach the given color list, if it isn't already displaying the list.

- (void)attachColorList:(NSColorList \*) *colorList*

**Parameters***colorList*

The color list to display.

**Discussion**

You never invoke this method; it's invoked automatically by the `NSColorPanel` object when its `attachColorList:` (page 726) method is invoked. Because the `NSColorPanel` list mode manages `NSColorList` objects, this method need only be implemented by a custom color picker that manages `NSColorList` objects itself.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- `detachColorList:` (page 3479)

**Declared In**

`NSColorPicking.h`

## buttonToolTip

Provides the toolbar button help tag.

- (NSString \*)buttonToolTip

**Return Value**

Help tag text.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

`NSColorPicking.h`

## detachColorList:

Tells the receiver to detach the given color list, unless the receiver isn't displaying the list.

- (void)detachColorList:(NSColorList \*)colorList

**Parameters***colorList*

The color list to detach.

**Discussion**

You never invoke this method; it's invoked automatically by the `NSColorPanel` object when its `detachColorList:` (page 727) method is invoked. Because the `NSColorPanel` list mode manages `NSColorList` objects, this method need only be implemented by a custom color picker that manages `NSColorList` objects itself.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [attachColorList:](#) (page 3478)

**Declared In**

NSColorPicking.h

**initWithPickerMask:colorPanel:**

Initializes the receiver with a given color panel and its mode.

```
- (id)initWithPickerMask:(NSUInteger)panelModes colorPanel:(NSColorPanel
*)owningColorPanel
```

**Parameters**

*panelModes*

A mask indicating the various color picker modes supported by the color panel. This is determined by the argument to the `NSColorPanel` method [setPickerMask:](#) (page 724). If it has not been set, *panelModes* is `NSColorPanelAllModesMask`. If your color picker supports any additional modes, you should invoke the [setPickerMask:](#) (page 724) method when your application initializes to notify the `NSColorPanel` class. The standard mode constants are defined in “Choosing the Color Pickers in a Color Panel”.

*owningColorPanel*

The color panel that owns the receiver.

**Return Value**

If your color picker responds to any of the modes represented in *panelModes*, it should perform its initialization and return an initialized color picker. Color pickers that do so have their buttons inserted in the color panel and continue to receive messages from the panel as the user manipulates it. If the color picker doesn't respond to any of the modes represented in *panelModes*, it should do nothing and return `nil`.

**Discussion**

This method is sent by the `NSColorPanel` to all implementors of the color-picking protocols when the application's color panel is first initialized. In order for your color picker to receive this message, it must have a bundle in your application's “ColorPickers” directory (described in “Color Picker Bundles”).

This method should examine the mask and determine whether it supports any of the modes included there. You may also check the value in *mask* to enable or disable any subpickers or optional controls implemented by your color picker. Your color picker may also retain *owningColorPanel* in an instance variable for future communication with the color panel.

This method is provided to initialize your color picker; however, much of a color picker's initialization may be done lazily through the `NSColorPickingCustom` protocol's [provideNewView:](#) (page 3474) method.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

+ [setPickerMask:](#) (page 724) (`NSColorPanel` class)

**Declared In**

NSColorPicking.h

## insertNewButtonImage:in:

Sets the image of a given button cell.

```
- (void)insertNewButtonImage:(NSImage *)newButtonImage in:(NSButtonCell *)buttonCell
```

### Parameters

*newButtonImage*

The image to set for the button cell.

*buttonCell*

The `NSButtonCell` object that lets the user choose the picker from the color panel—the color picker’s representation in the `NSMatrix` of the `NSColorPanel`.

### Discussion

This method should perform application-specific manipulation of the image before it’s inserted and displayed by the button cell.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

– [provideNewButtonImage](#) (page 3481)

### Declared In

`NSColorPicking.h`

## minContentSize

Indicates the receiver’s minimum content size.

```
- (NSSize)minContentSize
```

### Discussion

The receiver does not allow a size smaller than `minContentSize`.

### Availability

Available in Mac OS X v10.5 and later.

### Declared In

`NSColorPicking.h`

## provideNewButtonImage

Provides the image of the button used to select the receiver in the color panel.

```
- (NSImage *)provideNewButtonImage
```

### Return Value

The image for the mode button the user uses to select this picker in the color panel; that is, the color picker’s representation in the `NSMatrix` of the `NSColorPanel`.

This image is the same one the color panel uses as an argument when sending the [insertNewButtonImage:in:](#) (page 3481) message.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSColorPicking.h

**setMode:**

Specifies the receiver's mode.

- (void)setMode:(NSColorPanelMode)*mode*

**Parameters**

*mode*

The color picker mode. The available modes are described in “Choosing the Color Pickers in a Color Panel”.

**Discussion**

This method is invoked by the NSColorPanel method [setMode:](#) (page 730) method to ensure the color picker reflects the current mode. For example, invoke this method during color picker initialization to ensure that all color pickers are restored to the mode the user left them in the last time an NSColorPanel was used.

Most color pickers have only one mode and thus don't need to do any work in this method. An example of a color picker that uses this method is the slider picker, which can choose from one of several submodes depending on the value of *mode*.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSColorPicking.h

**viewSizeChanged:**

Tells the receiver when the color panel's view size changes in a way that might affect the color picker.

- (void)viewSizeChanged:(id)*sender*

**Parameters**

*sender*

The NSColorPanel that contains the color picker.

**Discussion**

Use this method to perform special preparation when resizing the color picker's view. Because this method is invoked only as appropriate, it's better to implement this method than to override the method `superviewSizeChanged:` for the NSView in which the color picker's user interface is contained.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [provideNewView:](#) (page 3474) (NSColorPickingCustom protocol)

**Declared In**

NSColorPicking.h

# NSComboBoxCellDataSource Protocol Reference

(informal protocol)

---

|                        |                                             |
|------------------------|---------------------------------------------|
| <b>Framework</b>       | /System/Library/Frameworks/AppKit.framework |
| <b>Declared in</b>     | AppKit/NSComboBoxCell.h                     |
| <b>Companion guide</b> | Combo Box Programming Topics                |

## Overview

The `NSComboBoxCellDataSource` category declares the methods that an `NSComboBoxCell` uses to access the contents of its data source object.

For more information, see “Providing Data for a Combo Box”.

## Tasks

### Returning Information About Combo Box Items

- `comboBoxCell:objectValueForItemAtIndex:` (page 3487)  
Returns the object that corresponds to the item at the given index in the combo box cell.
- `numberOfItemsInComboBoxCell:` (page 3487)  
Returns the number of items managed for the combo box cell by your data source object.

### Working with Entered Strings

- `comboBoxCell:completedString:` (page 3486)  
Returns the item from the combo box's pop-up list that matches the text entered by the user.
- `comboBoxCell:indexOfItemWithStringValue:` (page 3486)  
Invoked by an `NSComboBoxCell` object to synchronize the pop-up list's selected item with the text field's contents.

## Instance Methods

### **comboBoxCell:completedString:**

Returns the item from the combo box's pop-up list that matches the text entered by the user.

```
- (NSString *)comboBoxCell:(NSComboBoxCell *)aComboBoxCell completedString:(NSString *)uncompletedString
```

#### **Parameters**

*aComboBoxCell*

The combo box cell.

*uncompletedString*

The substring containing the text the user typed into the text field of the combo box cell.

#### **Return Value**

The completed string, from the items in the pop-up list, that matches the text entered by the user. Your implementation should return the first complete string that starts with *uncompletedString*.

#### **Discussion**

An `NSComboBoxCell` object uses this method to perform incremental—or “smart”—searches when the user types into the text field.

As the user types in the text field, the receiver uses this method to search for items from the pop-up list that start with what the user has typed. The receiver adds the new text to the end of the field and selects the new text, so when the user types another character, it replaces the new text.

This method is optional. If you don't implement it, the receiver does not perform incremental searches.

#### **Availability**

Available in Mac OS X v10.0 and later.

#### **Declared In**

`NSComboBoxCell.h`

### **comboBoxCell:indexOfItemWithStringValue:**

Invoked by an `NSComboBoxCell` object to synchronize the pop-up list's selected item with the text field's contents.

```
- (NSInteger)comboBoxCell:(NSComboBoxCell *)aComboBoxCell
 indexOfItemWithStringValue:(NSString *)aString
```

#### **Parameters**

*aComboBoxCell*

The combo box cell.

*aString*

The string to match. If `comboBoxCell:completedString:` (page 3486) is implemented, *aString* is the string returned by that method. Otherwise, *aString* is the text that the user has typed.

#### **Return Value**

The index for the pop-up list item matching *aString*, or `NSNotFound` if no item matches.

**Discussion**

This method is optional. If you don't implement it, the receiver does not synchronize the pop-up list's selected item with the text field's contents.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSComboBoxCell.h

**comboBoxCell:objectValueForItemAtIndex:**

Returns the object that corresponds to the item at the given index in the combo box cell.

```
- (id)comboBoxCell:(NSComboBoxCell *)aComboBoxCell
 objectValueForItemAtIndex:(NSInteger)index
```

**Parameters**

*aComboBoxCell*

The combo box cell for which to return the item.

*index*

The index of the item to return.

**Return Value**

The object corresponding to the item at the specified index in the given combo box cell.

**Discussion**

Your data source must implement this method.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSComboBoxCell.h

**numberOfItemsInComboBoxCell:**

Returns the number of items managed for the combo box cell by your data source object.

```
- (NSInteger)numberOfItemsInComboBoxCell:(NSComboBoxCell *)aComboBoxCell
```

**Parameters**

*aComboBoxCell*

The combo box cell for which your data source manages items.

**Return Value**

The number of items your data source object manages.

**Discussion**

An `NSComboBoxCell` object uses this method to determine how many items it should display in its pop-up list. Your data source must implement this method.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSComboBoxCell.h

|                        |                                             |
|------------------------|---------------------------------------------|
| <b>Framework</b>       | /System/Library/Frameworks/AppKit.framework |
| <b>Declared in</b>     | AppKit/NSComboBox.h                         |
| <b>Companion guide</b> | Combo Box Programming Topics                |

## Overview

The `NSComboBoxDataSource` informal protocol declares the methods that an `NSComboBox` object uses to access the contents of its data source object.

For more information, see “Providing Data for a Combo Box”.

## Tasks

### Returning Information About Combo Box Items

- `comboBox:objectValueForItemAtIndex:` (page 3491)  
Returns the object that corresponds to the item at the specified index in the combo box.
- `numberOfItemsInComboBox:` (page 3491)  
Returns the number of items that the data source manages for the combo box.

### Working with Entered Strings

- `comboBox:completedString:` (page 3489)  
Returns the first item from the pop-up list that starts with the text the user has typed.
- `comboBox:indexOfItemWithStringValue:` (page 3490)  
Returns the index of the combo box item matching the specified string.

## Instance Methods

### **comboBox:completedString:**

Returns the first item from the pop-up list that starts with the text the user has typed.

```
- (NSString *)comboBox:(NSComboBox *)aComboBox completedString:(NSString *)uncompletedString
```

**Parameters**

*aComboBox*

The combo box.

*uncompletedString*

The string to match against items in the combo box's pop-up list. This is text that the user has typed.

**Return Value**

The first complete string from the items in the combo box's pop-up list that starts with the string in *uncompletedString*.

**Discussion**

An `NSComboBox` object uses this method to perform incremental—or “smart”—searches when the user types into the text field. As the user types in the text field, the receiver uses this method to search for items from the pop-up list that start with what the user has typed. The receiver adds the new text to the end of the field and selects the new text, so when the user types another character, it replaces the new text.

This method is optional. If you don't implement it, the receiver does not perform incremental searches.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSComboBox.h`

**comboBox:indexOfItemWithStringValue:**

Returns the index of the combo box item matching the specified string.

```
- (NSInteger)comboBox:(NSComboBox *)aComboBox indexOfItemWithStringValue:(NSString *)aString
```

**Parameters**

*aComboBox*

The combo box.

*aString*

The string to match against the items in the combo box. If `comboBox:completedString:` (page 3489) is implemented, this is the string returned by that method. Otherwise, it is the text that the user has typed.

**Return Value**

The index for the item that matches the specified string, or `NSNotFound` if no item matches.

**Discussion**

An `NSComboBox` object uses this method to synchronize the pop-up list's selected item with the text field's contents. This method is optional. If you don't implement it, the receiver does not synchronize the pop-up list's selected item with the text field's contents.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSComboBox.h

**comboBox:objectValueForItemAtIndex:**

Returns the object that corresponds to the item at the specified index in the combo box.

```
- (id)comboBox:(NSComboBox *)aComboBox objectValueForItemAtIndex:(NSInteger)index
```

**Parameters***aComboBox*

The combo box.

*index*

The index of the item to return.

**Return Value**

The object corresponding to the specified index number.

**Discussion**

Your data source must implement this method.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSComboBox.h

**numberOfItemsInComboBox:**

Returns the number of items that the data source manages for the combo box.

```
- (NSInteger)numberOfItemsInComboBox:(NSComboBox *)aComboBox
```

**Parameters***aComboBox*

The combo box.

**Return Value**

The number of items that the data source object manages for the specified combo box.

**Discussion**

An `NSComboBox` object uses this method to determine how many items it should display in its pop-up list. Your data source must implement this method.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSComboBox.h

# NSDictionaryControllerKeyValuePair Protocol Reference

|                        |                                             |
|------------------------|---------------------------------------------|
| <b>Framework</b>       | /System/Library/Frameworks/AppKit.framework |
| <b>Declared in</b>     | AppKit/NSDictionaryController.h             |
| <b>Availability</b>    | Available in Mac OS X v10.5 and later.      |
| <b>Companion guide</b> | Cocoa Bindings Programming Topics           |

## Overview

`NSDictionaryControllerKeyValuePair` is an informal protocol that is implemented by objects returned by the `NSDictionaryController` method `arrangedObjects`. See *NSDictionaryController Class Reference* for more information.

## Tasks

### Localizing the Display Key

- `setLocalizedKey:` (page 3495)  
Sets the localized key name for the receiver.
- `localizedKey` (page 3494)  
Returns the receiver's localized key name.

### Key-Value Pair Settings

- `setKey:` (page 3495)  
Sets the key name for the receiver.
- `key` (page 3494)  
Returns the receiver's key name.
- `setValue:` (page 3495)  
Sets the receiver's value.
- `value` (page 3496)  
Returns the receiver's value.
- `isExplicitlyIncluded` (page 3494)  
Specifies whether the receiver's key name is an included key.

## Instance Methods

### **isExplicitlyIncluded**

Specifies whether the receiver's key name is an included key.

- (BOOL)isExplicitlyIncluded

#### **Return Value**

YES if the key name is specified as an included key, otherwise NO.

#### **Availability**

Available in Mac OS X v10.5 and later.

#### **Declared In**

NSDictionaryController.h

### **key**

Returns the receiver's key name.

- (NSString \*)key

#### **Return Value**

The key name.

#### **Availability**

Available in Mac OS X v10.5 and later.

# NSDraggingDestination Protocol Reference

(informal protocol)

---

|                        |                                             |
|------------------------|---------------------------------------------|
| <b>Framework</b>       | /System/Library/Frameworks/AppKit.framework |
| <b>Declared in</b>     | AppKit/NSDragging.h                         |
| <b>Companion guide</b> | Drag and Drop Programming Topics for Cocoa  |

## Overview

The `NSDraggingDestination` informal protocol declares methods that the destination object (or recipient) of a dragged image must implement. The destination automatically receives `NSDraggingDestination` messages for pasteboard data types it has registered for as an image enters, moves around inside, and then exits or is released within the destination's boundaries.

## Tasks

### Managing a Dragging Session Before an Image Is Released

- [draggingEntered:](#) (page 3499)  
Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.
- [wantsPeriodicDraggingUpdates](#) (page 3502)  
Asks the destination object whether it wants to receive periodic [draggingUpdated:](#) (page 3500) messages.
- [draggingUpdated:](#) (page 3500)  
Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.
- [draggingEnded:](#) (page 3498)  
Implement this method to be notified when a drag operation ends in some other destination.
- [draggingExited:](#) (page 3499)  
Invoked when the dragged image exits the destination's bounds rectangle (in the case of a view object) or its frame rectangle (in the case of a window object).

### Managing a Dragging Session After an Image Is Released

- [prepareForDragOperation:](#) (page 3501)  
Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.

- [performDragOperation:](#) (page 3501)  
Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.
- [concludeDragOperation:](#) (page 3498)  
Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.

## Instance Methods

### concludeDragOperation:

Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.

```
- (void)concludeDragOperation:(id < NSDraggingInfo >)sender
```

#### Parameters

*sender*

The object sending the message; use it to get details about the dragging operation.

#### Discussion

For this method to be invoked, the previous [performDragOperation:](#) (page 3501) must have returned YES. The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from *sender* to the destination during a dragging session.

#### Availability

Available in Mac OS X v10.0 and later.

#### Declared In

NSDragging.h

### draggingEnded:

Implement this method to be notified when a drag operation ends in some other destination.

```
- (void)draggingEnded:(id < NSDraggingInfo >)sender
```

#### Parameters

*sender*

The object sending the message; use it to get details about the dragging operation.

#### Discussion

This method might be used by a destination doing auto-expansion in order to collapse any auto-expands. This method has not yet been implemented.

#### Availability

Available in Mac OS X v10.0 and later.

#### Declared In

NSDragging.h

## draggingEntered:

Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.

```
- (NSDragOperation)draggingEntered:(id < NSDraggingInfo >)sender
```

### Parameters

*sender*

The object sending the message; use it to get details about the dragging operation.

### Return Value

One (and only one) of the dragging operation constants described in “Constants” (page 3508) in the `NSDraggingInfo` reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous `draggingEntered:` (page 3499) message.

### Discussion

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination’s bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from *sender* with the `draggingSourceOperationMask` (page 3507) method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return `NSDragOperationNone` (this is the default response if the method is not implemented by the destination). A destination will still receive `draggingUpdated:` (page 3500) and `draggingExited:` (page 3499) even if `NSDragOperationNone` is returned by this method.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- `draggingUpdated:` (page 3500)
- `draggingExited:` (page 3499)
- `prepareForDragOperation:` (page 3501)

### Declared In

`NSDragging.h`

## draggingExited:

Invoked when the dragged image exits the destination’s bounds rectangle (in the case of a view object) or its frame rectangle (in the case of a window object).

```
- (void)draggingExited:(id < NSDraggingInfo >)sender
```

### Parameters

*sender*

The object sending the message; use it to get details about the dragging operation.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSDragging.h

**draggingUpdated:**

Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.

```
- (NSDragOperation)draggingUpdated:(id < NSDraggingInfo >)sender
```

**Parameters**

*sender*

The object sending the message; use it to get details about the dragging operation.

**Return Value**

One (and only one) of the dragging operation constants described in “Constants” (page 3508) in the `NSDraggingInfo` reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous `draggingEntered:` (page 3499) message.

**Discussion**

For this to be invoked, the destination must have registered for the pasteboard data type involved in the drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on the position of the mouse pointer inside of the destination view or window object. For example, you may have several graphics or areas of text contained within the same view and wish to tailor the dragging operation, or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the time when the user releases the dragged image and the `performDragOperation:` (page 3501) method is invoked.

You typically examine the contents of the pasteboard in the `draggingEntered:` (page 3499) method, where this examination is performed only once, rather than in the `draggingUpdated:` (page 3500) method, which is invoked multiple times.

Only one destination at a time receives a sequence of `draggingUpdated:` (page 3500) messages. If the mouse pointer is within the bounds of two overlapping views that are both valid destinations, the uppermost view receives these messages until the image is either released or dragged out.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- `draggingExited:` (page 3499)
- `prepareForDragOperation:` (page 3501)

**Declared In**

NSDragging.h

## performDragOperation:

Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.

- (BOOL)performDragOperation:(id < NSDraggingInfo >)sender

### Parameters

*sender*

The object sending the message; use it to get details about the dragging operation.

### Return Value

If the destination accepts the data, it returns YES; otherwise it returns NO. The default is to return NO.

### Discussion

For this method to be invoked, the previous [prepareForDragOperation:](#) (page 3501) message must have returned YES. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [concludeDragOperation:](#) (page 3498)

### Declared In

NSDragging.h

## prepareForDragOperation:

Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.

- (BOOL)prepareForDragOperation:(id < NSDraggingInfo >)sender

### Parameters

*sender*

The object sending the message; use it to get details about the dragging operation.

### Return Value

YES if the receiver agrees to perform the drag operation and NO if not.

### Discussion

This method is invoked only if the most recent [draggingEntered:](#) (page 3499) or [draggingUpdated:](#) (page 3500) message returned an acceptable drag-operation value.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [performDragOperation:](#) (page 3501)

### Declared In

NSDragging.h

## wantsPeriodicDraggingUpdates

Asks the destination object whether it wants to receive periodic [draggingUpdated:](#) (page 3500) messages.

- (BOOL)wantsPeriodicDraggingUpdates

### Return Value

YES if the destination wants to receive periodic [draggingUpdated:](#) (page 3500) messages, NO otherwise.

### Discussion

If the destination returns NO, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated messages even if nothing changes.

### Availability

Available in Mac OS X v10.4 and later.

### Declared In

NSDragging.h

# NSDraggingInfo Protocol Reference

---

|                        |                                             |
|------------------------|---------------------------------------------|
| <b>Framework</b>       | /System/Library/Frameworks/AppKit.framework |
| <b>Availability</b>    | Available in Mac OS X v10.0 and later.      |
| <b>Declared in</b>     | AppKit/NSDragging.h                         |
| <b>Companion guide</b> | Drag and Drop Programming Topics for Cocoa  |

## Overview

The `NSDraggingInfo` protocol declares methods that supply information about a dragging session. `NSDraggingInfo` methods are designed to be invoked from within a class's implementation of `NSDraggingDestination` informal protocol methods. The Application Kit automatically passes an object that conforms to the `NSDraggingInfo` protocol as the argument to each of the methods defined by `NSDraggingDestination`. `NSDraggingInfo` messages should be sent to this object; you never need to create a class that implements the `NSDraggingInfo` protocol.

## Tasks

### Obtaining Information About the Dragging Session

- [draggingPasteboard](#) (page 3506)  
Returns the pasteboard object that holds the data being dragged.
- [draggingSequenceNumber](#) (page 3506)  
Returns a number that uniquely identifies the dragging session.
- [draggingSource](#) (page 3506)  
Returns the source, or owner, of the dragged data.
- [draggingSourceOperationMask](#) (page 3507)  
Returns the dragging operation mask of the dragging source.
- [draggingLocation](#) (page 3505)  
Returns the current location of the mouse pointer in the base coordinate system of the destination object's window.
- [draggingDestinationWindow](#) (page 3505)  
Returns the destination window for the dragging operation.

- [namesOfPromisedFilesDroppedAtDestination:](#) (page 3507)  
Sets the drop location for promised files and returns the names of the files that the receiver promises to create there.

## Getting Image Information

- [draggedImage](#) (page 3504)  
Returns the image being dragged.
- [draggedImageLocation](#) (page 3504)  
Returns the current location of the dragged image's origin.

## Sliding the Image

- [slideDraggedImageTo:](#) (page 3508)  
Slides the image to a specified location. (**Deprecated.** Deprecated as of Mac OS X v10.5. There is no alternative method.)

## Instance Methods

### draggedImage

Returns the image being dragged.

- (NSImage \*)draggedImage

#### Return Value

The image being dragged.

#### Discussion

This image object visually represents the data put on the pasteboard during the drag operation; however, it is the pasteboard data and not this image that is ultimately utilized in the dragging operation.

#### Availability

Available in Mac OS X v10.0 and later.

#### See Also

- [draggedImageLocation](#) (page 3504)

#### Declared In

NSDragging.h

### draggedImageLocation

Returns the current location of the dragged image's origin.

- (NSPoint)draggedImageLocation

**Return Value**

The dragged image's origin, in the base coordinate system of the destination object's window.

**Discussion**

The image moves along with the mouse pointer (the position of which is given by [draggingLocation](#) (page 3505)) but may be positioned at some offset.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [draggedImage](#) (page 3504)

**Declared In**

`NSDragging.h`

## **draggingDestinationWindow**

Returns the destination window for the dragging operation.

– (NSWindow \*)draggingDestinationWindow

**Return Value**

The destination window for the dragging operation.

**Discussion**

Either this window is the destination itself, or it contains the view object that is the destination.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSDragging.h`

## **draggingLocation**

Returns the current location of the mouse pointer in the base coordinate system of the destination object's window.

– (NSPoint)draggingLocation

**Return Value**

The current location of the mouse pointer in the base coordinate system of the destination object's window.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [draggedImageLocation](#) (page 3504)

**Declared In**

`NSDragging.h`

## draggingPasteboard

Returns the pasteboard object that holds the data being dragged.

- (NSPasteboard \*)draggingPasteboard

### Return Value

The pasteboard object that holds the data being dragged.

### Discussion

The dragging operation that is ultimately performed utilizes this pasteboard data and not the image returned by the [draggedImage](#) (page 3504) method.

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

NSDragging.h

## draggingSequenceNumber

Returns a number that uniquely identifies the dragging session.

- (NSInteger)draggingSequenceNumber

### Return Value

A number that uniquely identifies the dragging session.

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

NSDragging.h

## draggingSource

Returns the source, or owner, of the dragged data.

- (id)draggingSource

### Return Value

The source, or owner, of the dragged data.

### Discussion

This method returns `nil` if the source is not in the same application as the destination. The dragging source implements methods from the `NSDraggingSource` informal protocol.

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

NSDragging.h

## draggingSourceOperationMask

Returns the dragging operation mask of the dragging source.

- (NSDragOperation)draggingSourceOperationMask

### Return Value

The dragging operation mask, which is declared by the dragging source through its [draggingSourceOperationMaskForLocal:](#) (page 3514) method. If the source does not permit any dragging operations, this method should return `NSDragOperationNone`.

### Discussion

If the source permits dragging operations, the elements in the mask are one or more of the constants described in [NSDragOperation](#) (page 3508), combined using the C bitwise OR operator.

If the user is holding down a modifier key during the dragging session and the source does not prohibit modifier keys from affecting the drag operation (through its [ignoreModifierKeysWhileDragging](#) (page 3514) method), then the operating system combines the dragging operation value that corresponds to the modifier key (see the descriptions below) with the source's mask using the C bitwise AND operator.

The modifier keys are associated with the dragging operation options shown below:

| Modifier Key | Dragging Operation                  |
|--------------|-------------------------------------|
| Control      | <code>NSDragOperationLink</code>    |
| Option       | <code>NSDragOperationCopy</code>    |
| Command      | <code>NSDragOperationGeneric</code> |

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

`NSDragging.h`

## namesOfPromisedFilesDroppedAtDestination:

Sets the drop location for promised files and returns the names of the files that the receiver promises to create there.

- (NSArray \*)namesOfPromisedFilesDroppedAtDestination:(NSURL \*)dropDestination

### Parameters

*dropDestination*

A URL object specifying the drop location for promised files.

### Return Value

An array of file names, which are not full paths.

### Discussion

Drag destinations should invoke this method within their [performDragOperation:](#) (page 3501) method. The source may or may not have created the files by the time this method returns.

**Availability**

Available in Mac OS X v10.2 and later.

**Declared In**

NSDragging.h

**slideDraggedImageTo:**

Slides the image to a specified location. (**Deprecated.** Deprecated as of Mac OS X v10.5. There is no alternative method.)

```
- (void)slideDraggedImageTo:(NSPoint)aPoint
```

**Parameters**

*aPoint*

A point that specifies a location in the screen coordinate system.

**Discussion**

Calling this method has no effect on the image.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSDragging.h

## Constants

**NSDragOperation**

Type representing drag operations.

```
typedef unsigned int NSDragOperation;
```

**Discussion**

See `Dragging operations` for values.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSDragging.h

## Dragging operations

These constants are used by [draggingSourceOperationMask](#) (page 3507).

```
enum {
 NSDragOperationNone = 0,
 NSDragOperationCopy = 1,
 NSDragOperationLink = 2,
 NSDragOperationGeneric = 4,
 NSDragOperationPrivate = 8,
 NSDragOperationAll_Obsolete = 15,
 NSDragOperationMove = 16,
 NSDragOperationDelete = 32,
 NSDragOperationEvery = UINT_MAX
};
```

**Constants****NSDragOperationCopy**

The data represented by the image can be copied.

Available in Mac OS X v10.0 and later.

Declared in `NSDragging.h`.

**NSDragOperationLink**

The data can be shared.

Available in Mac OS X v10.0 and later.

Declared in `NSDragging.h`.

**NSDragOperationGeneric**

The operation can be defined by the destination.

Available in Mac OS X v10.0 and later.

Declared in `NSDragging.h`.

**NSDragOperationPrivate**

The operation is negotiated privately between the source and the destination.

Available in Mac OS X v10.0 and later.

Declared in `NSDragging.h`.

**NSDragOperationAll\_Obsolete**

The `NSDragOperationAll` constant is deprecated. Use `NSDragOperationEvery` instead.

Available in Mac OS X v10.0 and later.

Declared in `NSDragging.h`.

**NSDragOperationMove**

The data can be moved.

Available in Mac OS X v10.0 and later.

Declared in `NSDragging.h`.

**NSDragOperationDelete**

The data can be deleted.

Available in Mac OS X v10.0 and later.

Declared in `NSDragging.h`.

**NSDragOperationEvery**

All of the above.

Available in Mac OS X v10.0 and later.

Declared in `NSDragging.h`.

`NSDragOperationNone`

No drag operations are allowed.

Available in Mac OS X v10.0 and later.

Declared in `NSDragging.h`.

**Declared In**

`NSDragging.h`

# NSDraggingSource Protocol Reference

(informal protocol)

---

|                        |                                             |
|------------------------|---------------------------------------------|
| <b>Framework</b>       | /System/Library/Frameworks/AppKit.framework |
| <b>Declared in</b>     | AppKit/NSDragging.h                         |
| <b>Companion guide</b> | Drag and Drop Programming Topics for Cocoa  |

## Overview

The `NSDraggingSource` informal protocol declares methods that are implemented by the source object in a dragging session. The dragging source is specified as an argument to the `dragImage:at:offset:event:pasteboard:source:slideBack:` (page 3118) message, sent to a window or view object to initiate the dragging session.

Of the methods declared below, only `draggingSourceOperationMaskForLocal:` (page 3514) must be implemented. The other methods are invoked only if the dragging source implements them. All methods are invoked automatically during a dragging session—you never send an `NSDraggingSource` message directly to an object.

## Tasks

### Specifying Dragging Options

- `draggingSourceOperationMaskForLocal:` (page 3514)  
Returns an integer bit mask indicating the types of dragging operations the source object will allow to be performed on the dragged image's data.
- `ignoreModifierKeysWhileDragging` (page 3514)  
Sets whether the use of modifier keys should have an effect on the type of operation performed.

### Responding to Messages During a Dragging Sessions

- `draggedImage:beganAt:` (page 3512)  
Gives the source object an opportunity to respond to the initiation of a dragging session.
- `draggedImage:movedTo:` (page 3513)  
Informs the dragging source when a dragged image moves to a new screen coordinate.

- [draggedImage:endedAt:deposited:](#) (page 3512)  
Invoked after the dragging destination has been given a chance to operate on the data represented by the image, (Deprecated)
- [draggedImage:endedAt:operation:](#) (page 3513)  
Invoked after the dragging destination has been given a chance to operate on the data represented by the image,
- [namesOfPromisedFilesDroppedAtDestination:](#) (page 3515)  
Returns the names of the files that the receiver promises to create at a specified location.

## Instance Methods

### draggedImage:beganAt:

Gives the source object an opportunity to respond to the initiation of a dragging session.

```
(void)draggedImage:(NSImage *)anImage beganAt:(NSPoint)aPoint
```

#### Parameters

*anImage*

The image of the dragged item.

*aPoint*

The origin of the image in screen coordinates.

#### Discussion

This method is invoked when *anImage* is displayed but before it starts following the mouse. For example, you might choose to have the source give a visual indication to the user that data is being dragged from the source.

#### Availability

Available in Mac OS X v10.0 and later.

#### See Also

- [convertScreenToBase:](#) (page 3248) (NSWindow)
- [convertBaseToScreen:](#) (page 3248) (NSWindow)
- [convertPoint:fromView:](#) (page 3106) (NSView)
- [convertPoint:toView:](#) (page 3107) (NSView)

#### Declared In

NSDragging.h

### draggedImage:endedAt:deposited:

Invoked after the dragging destination has been given a chance to operate on the data represented by the image, (Deprecated)

```
(void)draggedImage:(NSImage *)anImage endedAt:(NSPoint)aPoint deposited:(BOOL)flag
```

#### Discussion

This method has been deprecated. Use [draggedImage:endedAt:operation:](#) (page 3513) instead.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSDragging.h

**draggedImage:endedAt:operation:**

Invoked after the dragging destination has been given a chance to operate on the data represented by the image,

```
- (void)draggedImage:(NSImage *)anImage endedAt:(NSPoint)aPoint
 operation:(NSDragOperation)operation
```

**Parameters**

*anImage*

The dragged image.

*aPoint*

The point locating the image's origin in the screen coordinate system when it was released.

*operation*

An integer constant that indicates the operation performed by the destination.

**Discussion**

This method is invoked after the dragged image (*anImage*) has been released and the dragging destination has been given a chance to operate on the data it represents. This method provides the source object with an opportunity to respond to either a successful or a failed dragging session. For example, if you are moving data from one location to another, you could use this method to make the source data disappear from its previous location, if the dragging session is successful, or reset itself to its previous state, in the event of a failure.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSDragging.h

**draggedImage:movedTo:**

Informs the dragging source when a dragged image moves to a new screen coordinate.

```
- (void)draggedImage:(NSImage *)draggedImage movedTo:(NSPoint)screenPoint
```

**Parameters**

*draggedImage*

The dragged image.

*screenPoint*

The point specifying the new location of the image in screen coordinates.

**Discussion**

This message is similar to the dragging destination being sent [draggingUpdated:](#) (page 3500) messages.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSDragging.h

**draggingSourceOperationMaskForLocal:**

Returns an integer bit mask indicating the types of dragging operations the source object will allow to be performed on the dragged image's data.

```
- (NSDragOperation)draggingSourceOperationMaskForLocal:(BOOL)isLocal
```

**Parameters**

*isLocal*

YES indicates that the candidate destination object (the window or view over which the dragged image is currently poised) is in the same application as the source, while a NO value indicates that the destination object is in a different application.

**Discussion**

This method is the only `NSDraggingSource` method that must be implemented by the source object. It should return a mask, built by combining the allowed dragging operations listed in the “[Constants](#)” (page 3508) section of the `NSDraggingInfo` protocol reference, using the C bitwise OR operator. If the source does not permit any dragging operations, it should return `NSDragOperationNone`.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSDragging.h

**ignoreModifierKeysWhileDragging**

Sets whether the use of modifier keys should have an effect on the type of operation performed.

```
- (BOOL)ignoreModifierKeysWhileDragging
```

**Discussion**

If this method is not implemented or returns NO, the user can tailor the drag operation by holding down a modifier key during the drag. The dragging option that corresponds to the modifier key is combined with the source's mask (as set with the [draggingSourceOperationMaskForLocal:](#) (page 3514) method) using the C bitwise AND operator. See the description for the [draggingSourceOperationMask](#) (page 3507) method in the `NSDraggingInfo` protocol specification for more information about dragging masks and modifier keys.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSDragging.h

**namesOfPromisedFilesDroppedAtDestination:**

Returns the names of the files that the receiver promises to create at a specified location.

- (NSArray \*)namesOfPromisedFilesDroppedAtDestination:(NSURL \*)*dropDestination*

**Parameters**

*dropDestination*

A URL object that identifies the location at which the promised files will be created.

**Return Value**

An array of the names of files (not full paths) that the receiver promises to create at *dropDestination*.

**Discussion**

This method is invoked when the drop has been accepted by the destination and the destination, in the case of another Cocoa application, invokes the NSDraggingInfo method

[namesOfPromisedFilesDroppedAtDestination:](#) (page 3507). For long operations, you can cache *dropDestination* and defer the creation of the files until the [draggedImage:endedAt:operation:](#) (page 3513) method to avoid blocking the destination application.

**Availability**

Available in Mac OS X v10.2 and later.

**Declared In**

NSDragging.h

# NSEditor Protocol Reference

(informal protocol)

---

|                        |                                             |
|------------------------|---------------------------------------------|
| <b>Adopted by</b>      | NSController (informal protocol)            |
| <b>Framework</b>       | /System/Library/Frameworks/AppKit.framework |
| <b>Declared in</b>     | AppKit/NSKeyValueBinding.h                  |
| <b>Availability</b>    | Available in Mac OS X v10.3 and later.      |
| <b>Companion guide</b> | Cocoa Bindings Programming Topics           |

## Overview

The NSEditor informal protocol is implemented by controllers and user interface elements. It provides a means for requesting that the receiver commit or discard any pending edits.

These methods are typically invoked on user interface elements by a controller. They can also be sent to a controller in response to a user's attempt to save a document or quit an application.

NSController provides an implementation of this protocol, as do the Application Kit user interface elements that support binding.

## Tasks

### Managing Editing

- [discardEditing](#) (page 3519)  
Causes the receiver to discard any changes, restoring the previous values.
- [commitEditing](#) (page 3518)  
Returns whether the receiver was able to commit any pending edits.
- [commitEditingWithDelegate:didCommitSelector:contextInfo:](#) (page 3518)  
Attempt to commit any currently edited results of the receiver.

## Instance Methods

### **commitEditing**

Returns whether the receiver was able to commit any pending edits.

- (BOOL)commitEditing

#### **Discussion**

Returns YES if the changes were successfully applied to the model, NO otherwise. A commit is denied if the receiver fails to apply the changes to the model object, perhaps due to a validation error.

#### **Availability**

Available in Mac OS X v10.3 and later.

#### **See Also**

- [discardEditing](#) (page 3519)

#### **Related Sample Code**

Core Data HTML Store

CoreRecipes

#### **Declared In**

NSKeyValueBinding.h

### **commitEditingWithDelegate:didCommitSelector:contextInfo:**

Attempt to commit any currently edited results of the receiver.

```
- (void)commitEditingWithDelegate:(id)delegate
 didCommitSelector:(SEL)didCommitSelector contextInfo:(void *)contextInfo
```

#### **Discussion**

The receiver must have been registered as the editor of an object using `objectDidBeginEditing:`, and has not yet been unregistered by a subsequent invocation of `objectDidEndEditing:`. When the committing has either succeeded or failed, send the following message to the specified object. The *didCommitSelector* method must have the following method signature:

```
- (void)editor:(id)editor didCommit:(BOOL)didCommit contextInfo:(void *)contextInfo
```

If an error occurs while attempting to commit, for example if key-value coding validation fails, an implementation of this method should typically send the `NSView` in which editing is being done a `presentError:modalForWindow:delegate:didRecoverSelector:contextInfo: message`, specifying the view's containing window.

#### **Availability**

Available in Mac OS X v10.4 and later.

#### **Related Sample Code**

CoreRecipes

**Declared In**

NSKeyValueBinding.h

**discardEditing**

Causes the receiver to discard any changes, restoring the previous values.

- (void)discardEditing

**Availability**

Available in Mac OS X v10.3 and later.

**See Also**

- [commitEditing](#) (page 3518)

**Declared In**

# NSEditorRegistration Protocol Reference

(informal protocol)

---

|                        |                                             |
|------------------------|---------------------------------------------|
| <b>Adopted by</b>      | NSController (informal protocol)            |
| <b>Framework</b>       | /System/Library/Frameworks/AppKit.framework |
| <b>Declared in</b>     | AppKit/NSKeyValueBinding.h                  |
| <b>Availability</b>    | Available in Mac OS X v10.3 and later.      |
| <b>Companion guide</b> | Cocoa Bindings Programming Topics           |

## Overview

The NSEditorRegistration informal protocol is implemented by controllers to provide an interface for a view, the editor, to inform the controller when it has uncommitted changes.

An implementor is responsible for tracking which editors have uncommitted changes, and sending those editors `commitEditing` (page 3518) and `discardEditing` (page 3519) messages, as appropriate, to force the editor to submit, or discard, their values.

NSController provides an implementation of this protocol. You would implement this protocol if you wanted to provide your own controller class without subclassing NSController.

## Tasks

### Managing Editing

- `objectDidBeginEditing:` (page 3522)

This message should be sent to the receiver when *editor* has uncommitted changes that can affect the receiver.

- `objectDidEndEditing:` (page 3522)

This message should be sent to the receiver when *editor* has finished editing a property belonging to the receiver.

## Instance Methods

### **objectDidBeginEditing:**

This message should be sent to the receiver when *editor* has uncommitted changes that can affect the receiver.

- (void)objectDidBeginEditing:(id)*editor*

#### **Availability**

Available in Mac OS X v10.3 and later.

#### **See Also**

- [objectDidEndEditing:](#) (page 3522)

#### **Declared In**

NSKeyValueBinding.h

### **objectDidEndEditing:**

This message should be sent to the receiver when *editor* has finished editing a property belonging to the receiver.

- (void)objectDidEndEditing:(id)*editor*

#### **Availability**

Available in Mac OS X v10.3 and later.

#### **See Also**

- [objectDidBeginEditing:](#) (page 3522)

NSKeyValueBinding.h

# NSFontPanelValidation Protocol Reference

(informal protocol)

---

|                        |                                             |
|------------------------|---------------------------------------------|
| <b>Framework</b>       | /System/Library/Frameworks/AppKit.framework |
| <b>Declared in</b>     | AppKit/NSFontPanel.h                        |
| <b>Companion guide</b> | Font Panel                                  |

## Overview

Informal protocol. The Font Panel can be explicitly ordered to display some or all of its elements by responding to the [validModesForFontPanel:](#) (page 3523) instance method.

## Tasks

### Validating Modes for a Font Panel

- [validModesForFontPanel:](#) (page 3523)  
Returns the mode mask corresponding to the expected font panel mode.

## Instance Methods

### **validModesForFontPanel:**

Returns the mode mask corresponding to the expected font panel mode.

```
- (NSUInteger)validModesForFontPanel:(NSFontPanel *)fontPanel
```

#### **Discussion**

The mode masks are defined in [Mode Masks](#) (page 3524).

The Font Panel has the ability to hide elements that are not applicable for a given context by having the target respond to [validModesForFontPanel:](#). If the target desires a font panel mode other than the standard mode mask, it must respond to this method.

This message is sent up the responder chain to the first responder implementing the method. Ideally that object should be the first responder found that also implements [changeFont:](#) (page 1219).

**Availability**

Available in Mac OS X v10.3 and later.

**Declared In**

NSFontPanel.h

## Constants

### Mode Masks

The following constants correspond to the available font panel mode masks returned by `validModesForFontPanel:` (page 3523).

```
enum {
 NSFontPanelFaceModeMask = 1 << 0,
 NSFontPanelSizeModeMask = 1 << 1,
 NSFontPanelCollectionModeMask = 1 << 2,
 NSFontPanelUnderlineEffectModeMask = 1<<8,
 NSFontPanelStrikethroughEffectModeMask = 1<<9,
 NSFontPanelTextColorEffectModeMask = 1<< 10,
 NSFontPanelDocumentColorEffectModeMask = 1<<11,
 NSFontPanelShadowEffectModeMask = 1<<12,
 NSFontPanelAllEffectsModeMask = 0xFFFF00,
 NSFontPanelStandardModesMask = 0xFFFF,
 NSFontPanelAllModesMask = 0xFFFFFFFF
};
```

**Constants**

NSFontPanelFaceModeMask

Display the typeface column.

Available in Mac OS X v10.3 and later.

Declared in NSFontPanel.h.

NSFontPanelSizeModeMask

Display the font size column.

Available in Mac OS X v10.3 and later.

Declared in NSFontPanel.h.

NSFontPanelCollectionModeMask

Display the font collections column.

Available in Mac OS X v10.3 and later.

Declared in NSFontPanel.h.

NSFontPanelUnderlineEffectModeMask

Display the underline popup menu.

Available in Mac OS X v10.4 and later.

Declared in NSFontPanel.h.

`NSFontPanelStrikethroughEffectModeMask`

Display the strike-through popup menu.

Available in Mac OS X v10.4 and later.

Declared in `NSFontPanel.h`.

`NSFontPanelTextColorEffectModeMask`

Display the text color button.

Available in Mac OS X v10.4 and later.

Declared in `NSFontPanel.h`.

`NSFontPanelDocumentColorEffectModeMask`

Display the document color button.

Available in Mac OS X v10.4 and later.

Declared in `NSFontPanel.h`.

`NSFontPanelShadowEffectModeMask`

Display the shadow effects button.

Available in Mac OS X v10.4 and later.

Declared in `NSFontPanel.h`.

`NSFontPanelAllEffectsModeMask`

Display all the effects user interface items.

Available in Mac OS X v10.4 and later.

Declared in `NSFontPanel.h`.

`NSFontPanelStandardModesMask`

Display the standard default font panel—that is, including the collections, typeface, and size columns.

Available in Mac OS X v10.3 and later.

Declared in `NSFontPanel.h`.

`NSFontPanelAllModesMask`

Display all the available adornments.

Available in Mac OS X v10.3 and later.

Declared in `NSFontPanel.h`.

#### **Declared In**

|-------------------------|-----------------------------------------------------------------|
| <b>Adopted by</b>       | NSLayoutManager                                                 |
| <b>Framework</b>        | /System/Library/Frameworks/AppKit.framework                     |
| <b>Availability</b>     | Available in Mac OS X v10.3 and later.                          |
| <b>Declared in</b>      | AppKit/NSGlyphGenerator.h                                       |
| <b>Companion guides</b> | Text System Overview<br>Text Layout Programming Guide for Cocoa |

## Overview

The `NSGlyphStorage` protocol defines the methods that a glyph storage object must implement in order to interact properly with `NSGlyphGenerator`.

An example of a Cocoa class conforming to the `NSGlyphStorage` protocol is `NSLayoutManager`.

## Tasks

### Returning Text Storage

- `attributedString` (page 3528)  
Returns the text storage object from which the `NSGlyphGenerator` object procures characters for glyph generation.

### Returning Glyph Display Options

- `layoutOptions` (page 3529)  
Returns the current layout options.

### Modifying the Glyph Cache

- `insertGlyphs:length:forStartingGlyphAtIndex:characterIndex:` (page 3528)  
Inserts the given glyphs into the glyph cache and maps them to the specified characters.

- [setIntAttribute:value:forGlyphAtIndex:](#) (page 3529)  
Sets a custom attribute value for a given glyph.

## Instance Methods

### attributedString

Returns the text storage object from which the `NSGlyphGenerator` object procures characters for glyph generation.

```
- (NSAttributedString *)attributedString
```

#### Return Value

The receiver's text storage object.

#### Availability

Available in Mac OS X v10.3 and later.

#### Declared In

`NSGlyphGenerator.h`

### insertGlyphs:length:forStartingGlyphAtIndex:characterIndex:

Inserts the given glyphs into the glyph cache and maps them to the specified characters.

```
- (void)insertGlyphs:(const NSGlyph *)glyphs length:(NSUInteger)length
 forStartingGlyphAtIndex:(NSUInteger)glyphIndex
 characterIndex:(NSUInteger)charIndex
```

#### Parameters

*glyphs*

The glyphs to insert.

*glyphIndex*

Location in the glyph cache to begin inserting glyphs.

*length*

Number of glyphs to insert.

*charIndex*

Index of first character to be mapped.

#### Discussion

This is a bulk insert method for the glyph cache.

#### Availability

Available in Mac OS X v10.3 and later.

#### Declared In

`NSGlyphGenerator.h`

## layoutOptions

Returns the current layout options.

- (NSUInteger)layoutOptions

### Return Value

The layout options as a bit mask, as defined in “Constants” (page 3529).

### Availability

Available in Mac OS X v10.3 and later.

### Declared In

NSGlyphGenerator.h

## setIntAttribute:value:forGlyphAtIndex:

Sets a custom attribute value for a given glyph.

```
- (void)setIntAttribute:(NSInteger)attributeTag value:(NSInteger)val
 forGlyphAtIndex:(NSUInteger)glyphIndex
```

### Parameters

*attributeTag*

The custom attribute.

*val*

The new attribute value.

*glyphIndex*

Index of the glyph whose attribute is set.

### Discussion

Custom attributes are glyph attributes such as `NSGlyphInscription` or attributes defined by subclasses. Subclasses that define their own custom attributes must override this method and provide their own storage for the attribute values. Nonnegative tags are reserved; you can define your own attributes with negative tags and set values using this method.

### Availability

Available in Mac OS X v10.3 and later.

### Declared In

NSGlyphGenerator.h

## Constants

### Layout Options

These constants describe layout options returned as a bit mask by the `layoutOptions` (page 3529) method.

```
enum {
 NSShowControlGlyphs = (1 << 0),
 NSShowInvisibleGlyphs = (1 << 1),
 NSWantsBidiLevels = (1 << 2)
};
```

**Constants****NSShowControlGlyphs**

Generates displayable glyphs for control characters.

Available in Mac OS X v10.3 and later.

Declared in `NSGlyphGenerator.h`.**NSShowInvisibleGlyphs**

Generates displayable glyphs for invisible characters.

Available in Mac OS X v10.3 and later.

Declared in `NSGlyphGenerator.h`.**NSWantsBidiLevels**

Generates directional formatting codes for bidirectional text.

Available in Mac OS X v10.3 and later.

Declared in `NSGlyphGenerator.h`.**Declared In**`NSGlyphGenerator.h`

# NSIgnoreMisspelledWords Protocol Reference

|                        |                                             |
|------------------------|---------------------------------------------|
| <b>Adopted by</b>      | NSText                                      |
| <b>Framework</b>       | /System/Library/Frameworks/AppKit.framework |
| <b>Availability</b>    | Available in Mac OS X v10.0 and later.      |
| <b>Declared in</b>     | AppKit/NSSpellProtocol.h                    |
| <b>Companion guide</b> | Spell Checking                              |

## Overview

Implement this protocol to have the Ignore button in the Spelling panel function properly. The Ignore button allows the user to accept a word that the spelling checker believes is misspelled. In order for this action to update the “ignored words” list for the document being checked, the `NSIgnoreMisspelledWords` protocol must be implemented.

This protocol is necessary because a list of ignored words is useful only if it pertains to the entire document being checked, but the spelling checker (`NSSpellChecker` object) does not check the entire document for spelling at once. The spelling checker returns as soon as it finds a misspelled word. Thus, it checks only a subset of the document at any one time. The user usually wants to check the entire document, so usually several spelling checks are run in succession until no misspelled words are found. This protocol allows the list of ignored words to be maintained per document, even though the spelling checks are not run per document.

The `NSIgnoreMisspelledWords` protocol specifies a method, `ignoreSpelling:` (page 3532), which should be implemented like this:

```
- (void)ignoreSpelling:(id)sender {
 [[NSSpellChecker sharedSpellChecker] ignoreWord:[sender selectedCell]
stringValue]
 inSpellDocumentWithTag: myDocumentTag];
}
```

The second argument to the `NSSpellChecker` method `ignoreWord:inSpellDocumentWithTag:` (page 2477) is a tag that the `NSSpellChecker` can use to distinguish the documents being checked. Once the `NSSpellChecker` has a way to distinguish the various documents, it can append new ignored words to the appropriate list.

To make the ignored words feature useful, the application must store a document’s ignored words list with the document. See the `NSSpellChecker` class description for more information.

## Tasks

### Ignoring Spellings

- [ignoreSpelling:](#) (page 3532)

## Instance Methods

### ignoreSpelling:

- (void)ignoreSpelling:(id)sender

#### Discussion

Implement this action method to allow an application to ignore misspelled words on a document-by-document basis. This message is sent by the NSSpellChecker instance to the object whose text is being checked.

Implement this method by using the code shown in the protocol description.

#### Availability

Available in Mac OS X v10.0 and later.

#### Declared In

NSSpellProtocol.h

# NSInputServerMouseTracker Protocol Reference

|                        |                                             |
|------------------------|---------------------------------------------|
| <b>Adopted by</b>      | NSInputServer                               |
| <b>Framework</b>       | /System/Library/Frameworks/AppKit.framework |
| <b>Availability</b>    | Available in Mac OS X v10.0 and later.      |
| <b>Declared in</b>     | AppKit/NSInputServer.h                      |
| <b>Companion guide</b> | Text Input Management                       |

## Overview

An NSInputServiceProvider object (an ["NSInputServer"](#) (page 1413) subclass object or a delegate of an NSInputServer object) may need to implement this protocol. See the NSInputServiceProvider protocol description.

The methods in this protocol differ from typical mouse events in that they have an additional argument which is the index of the character within the text view's text storage. When an text view object forwards a mouse event to the input manager (with [handleMouseEvent:](#) (page 1408)), the input manager calls the text view's [characterIndexForPoint:](#) (page 3615) method to get the index, which it then passes on to the appropriate method in this protocol.

## Tasks

### Handling Mouse Events

- [mouseDownOnCharacterIndex:atCoordinate:withModifier:client:](#) (page 3534)  
A mouse down event happened at given *index* within the *sender* text view's text storage, at the given *point*, with modifier keys identified in *flags*.
- [mouseDraggedOnCharacterIndex:atCoordinate:withModifier:client:](#) (page 3534)  
A mouse dragged event happened at given *index* within the *sender* text view's text storage, at the given *point*, with modifier keys identified in *flags*.
- [mouseUpOnCharacterIndex:atCoordinate:withModifier:client:](#) (page 3534)  
A mouse up event happened at given *index* within the *sender* text view's text storage, at the given *point*, with modifier keys identified in *flags*.

## Instance Methods

### **mouseDownOnCharacterIndex:atCoordinate:withModifier:client:**

A mouse down event happened at given *index* within the *sender* text view's text storage, at the given *point*, with modifier keys identified in *flags*.

```
- (BOOL)mouseDownOnCharacterIndex:(NSUInteger)index atCoordinate:(NSPoint)point
 withModifier:(NSUInteger)flags client:(id)sender
```

#### **Discussion**

Returns YES if it consumes the event; in that case, a mouse dragged or a mouse up message will follow. If NO is returned, then neither of the other two events will follow.

#### **Availability**

Available in Mac OS X v10.0 and later.

#### **See Also**

- [handleMouseEvent:](#) (page 1408) (NSInputManager)

#### **Declared In**

NSInputServer.h

### **mouseDraggedOnCharacterIndex:atCoordinate:withModifier:client:**

A mouse dragged event happened at given *index* within the *sender* text view's text storage, at the given *point*, with modifier keys identified in *flags*.

```
- (BOOL)mouseDraggedOnCharacterIndex:(NSUInteger)index atCoordinate:(NSPoint)point
 withModifier:(NSUInteger)flags client:(id)sender
```

#### **Discussion**

Returns YES if it consumes the event; in that case, either another mouse dragged or a mouse up message will follow. If NO is returned, then neither message will follow.

#### **Availability**

Available in Mac OS X v10.0 and later.

#### **See Also**

- [handleMouseEvent:](#) (page 1408) (NSInputManager)

#### **Declared In**

NSInputServer.h

### **mouseUpOnCharacterIndex:atCoordinate:withModifier:client:**

A mouse up event happened at given *index* within the *sender* text view's text storage, at the given *point*, with modifier keys identified in *flags*.

```
- (void)mouseUpOnCharacterIndex:(NSUInteger)index atCoordinate:(NSPoint)point
 withModifier:(NSUInteger)flags client:(id)sender
```

**Discussion**

This event is always consumed.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [handleMouseEvent:](#) (page 1408) (NSInputManager)

**Declared In**

NSInputServer.h

# NSInputServiceProvider Protocol Reference

|                        |                                             |
|------------------------|---------------------------------------------|
| <b>Adopted by</b>      | NSInputServer                               |
| <b>Framework</b>       | /System/Library/Frameworks/AppKit.framework |
| <b>Availability</b>    | Available in Mac OS X v10.0 and later.      |
| <b>Declared in</b>     | AppKit/NSInputServer.h                      |
| <b>Companion guide</b> | Text Input Management                       |

## Overview

The NSInputServiceProvider protocol embodies most of the functionality of NSInputServer.

There are two ways you might use this protocol:

- You can subclass NSInputServer and create an instance of your subclass. Your subclass must override most or all of the NSInputServiceProvider protocol methods.
- You can create an NSInputServer object and designate a delegate. The delegate must implement the NSInputServiceProvider protocol.

All messages in this protocol are sent by the client text view except [insertText:client:](#) (page 3541) and [doCommandBySelector:client:](#) (page 3539), which are sent by "NSInputManager" (page 1405).

## Tasks

### Getting Input Service Provider Information

- [canBeDisabled](#) (page 3539)  
Returns YES if the receiver can be disabled when the sender is not a text view, NO

### Handling Events

- [wantsToDelayTextChangeNotifications](#) (page 3543)  
A YES return value tells the client that only a call to its [insertText:client:](#) (page 3541) method constitutes a modification to its text storage.

- [wantsToHandleMouseEvents](#) (page 3543)  
Returns YES if the client should forward all mouse events within the text view to the input server.
- [wantsToInterpretAllKeystrokes](#) (page 3544)  
Returns YES if the server wants all keystrokes to be sent to it as characters.
- [doCommandBySelector:client:](#) (page 3539)  
Handle the command identified by *aSelector*.
- [insertText:client:](#) (page 3541)  
Interpret the characters in *aString*, which is actually always an NSString.
- [activeConversationChanged:toNewConversation:](#) (page 3538)  
Keyboard focus just switched from another text view to this one.
- [activeConversationWillChange:fromOldConversation:](#) (page 3539)  
Keyboard focus is about to move away from this text view.
- [inputClientBecomeActive:](#) (page 3540)  
The client, *sender*, has become active.
- [inputClientEnabled:](#) (page 3541)  
A text view in the client, *sender*, has become the key-receiving first responder.
- [inputClientDisabled:](#) (page 3540)  
A text view in the client, *sender*, has ceased to be the key-receiving first responder.
- [inputClientResignActive:](#) (page 3541)  
The client, *sender*, is about to become inactive.
- [markedTextAbandoned:](#) (page 3542)  
Abandon any marked text state that may be in process.
- [markedTextSelectionChanged:client:](#) (page 3542)
- [terminate:](#) (page 3542)  
The client application is quitting.

## Instance Methods

### **activeConversationChanged:toNewConversation:**

Keyboard focus just switched from another text view to this one.

```
(void)activeConversationChanged:(id)sender
 toNewConversation:(NSInteger)newConversation
```

#### **Discussion**

This is called only when switching within the same application. *sender* can be cast to NSTextInput.

#### **Availability**

Available in Mac OS X v10.0 and later.

#### **See Also**

- [activeConversationWillChange:fromOldConversation:](#) (page 3539)
- [conversationIdentifier](#) (page 3615) (NSTextInput)

**Declared In**

NSInputServer.h

**activeConversationWillChange:fromOldConversation:**

Keyboard focus is about to move away from this text view.

```
- (void)activeConversationWillChange:(id)sender
 fromOldConversation:(NSInteger)oldConversation
```

**Discussion**

This is called only when switching within the same application. *sender* can be cast to `NSTextInput`.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [activeConversationChanged:toNewConversation:](#) (page 3538)
- [conversationIdentifier](#) (page 3615) (`NSTextInput`)

**Declared In**

NSInputServer.h

**canBeDisabled**

Returns YES if the receiver can be disabled when the sender is not a text view, NO

```
- (BOOL)canBeDisabled
```

**Discussion**

otherwise.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSInputServer.h

**doCommandBySelector:client:**

Handle the command identified by *aSelector*.

```
- (void)doCommandBySelector:(SEL)aSelector client:(id)sender
```

**Discussion**

The command can be from the set of `NSResponder` action methods or from the set of selector values in the `DefaultKeyBindings` dictionary referenced in the input server's "Info" file. *sender* can be cast to `NSTextInput`.

If you are subclassing `NSInputServer`, there is no need to override this method in the subclass. All you have to do is implement in the subclass the command methods you want to handle. If you do need to override this method, then you must call `super` for commands not handled.

If your `NSInputServer` uses a delegate, the delegate's implementation of this method must call `[sender doCommandBySelector:aSelector]` for commands it does not handle.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [doCommandBySelector:](#) (page 3616) (`NSTextInput`)

**Declared In**

`NSInputServer.h`

## **inputClientBecomeActive:**

The client, *sender*, has become active.

– `(void)inputClientBecomeActive:(id)sender`

**Discussion**

This is called when the client application starts up and whenever it becomes active after being inactive. *sender* can be cast to `NSTextInput`.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [inputClientEnabled:](#) (page 3541)  
– [inputClientResignActive:](#) (page 3541)

**Declared In**

`NSInputServer.h`

## **inputClientDisabled:**

A text view in the client, *sender*, has ceased to be the key-receiving first responder.

– `(void)inputClientDisabled:(id)sender`

**Discussion**

[inputClientResignActive:](#) (page 3541) may also be called just after this is called. *sender* can be cast to `NSTextInput`.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [inputClientEnabled:](#) (page 3541)  
– [inputClientResignActive:](#) (page 3541)

**Declared In**

`NSInputServer.h`

## inputClientEnabled:

A text view in the client, *sender*, has become the key-receiving first responder.

```
- (void)inputClientEnabled:(id)sender
```

### Discussion

This is called the first time any text view becomes enabled after client application activation and again whenever focus switches to a text view. [inputClientBecomeActive:](#) (page 3540) may have been called just before this is called. *sender* can be cast to `NSTextInput`.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [inputClientBecomeActive:](#) (page 3540)
- [inputClientDisabled:](#) (page 3540)

### Declared In

`NSInputServer.h`

## inputClientResignActive:

The client, *sender*, is about to become inactive.

```
- (void)inputClientResignActive:(id)sender
```

### Discussion

This is called when the client application quits and whenever it is deactivated. *sender* can be cast to `NSTextInput`.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [inputClientBecomeActive:](#) (page 3540)
- [inputClientDisabled:](#) (page 3540)
- [terminate:](#) (page 3542)

### Declared In

`NSInputServer.h`

## insertText:client:

Interpret the characters in *aString*, which is actually always an `NSString`.

```
- (void)insertText:(id)aString client:(id)sender
```

### Discussion

Here is where you do the interpreting of keyboard input. If your server's interpretation is disabled or the characters in *aString* are not of interest to the server, you can simply pass *aString* along to the sender's [insertText:](#) (page 3617) method. *sender* can be cast to `NSTextInput`.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [insertText:](#) (page 3617) (NSTextInput)

**Declared In**

NSInputServer.h

**markedTextAbandoned:**

Abandon any marked text state that may be in process.

- (void)markedTextAbandoned:(id) *sender*

**Discussion**

This can happen if the user clicks the mouse outside of the marked text area or if the window containing the text view closes. The client can do what it wants with the marked text. `NSTextView` leaves it as inserted text. *sender* can be cast to `NSTextInput`.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [markedTextSelectionChanged:client:](#) (page 3542)

- [markedTextAbandoned:](#) (page 1409) (NSInputManager)

**Declared In**

NSInputServer.h

**markedTextSelectionChanged:client:**

- (void)markedTextSelectionChanged:(NSRange) *newSelection* client:(id) *sender*

**Discussion**

The user selected a portion of the marked text or clicked at the beginning or end of marked text or somewhere in between. *sender* can be cast to `NSTextInput`.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [markedTextAbandoned:](#) (page 3542)

- [markedTextSelectionChanged:client:](#) (page 1410) (NSInputManager)

**Declared In**

NSInputServer.h

**terminate:**

The client application is quitting.

- (void)terminate:(id)sender

**Discussion**

This is called after [inputClientResignActive:](#) (page 3541). *sender* can be cast to `NSTextInput`.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [inputClientResignActive:](#) (page 3541)

**Declared In**

`NSInputServer.h`

## wantsToDelayTextChangeNotifications

A YES return value tells the client that only a call to its [insertText:client:](#) (page 3541) method constitutes a modification to its text storage.

- (BOOL)wantsToDelayTextChangeNotifications

**Discussion**

A NO return value tells the client that all text given to it, whether marked text or not, should constitute a modification to its text storage. A YES return value tells the client that only unmarked text given to it should constitute a modification to its text storage. The client may for example want to filter all text that is part of a modification but leave marked text unfiltered.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [wantsToDelayTextChangeNotifications](#) (page 1410) (`NSInputManager`)

**Declared In**

`NSInputServer.h`

## wantsToHandleMouseEvents

Returns YES if the client should forward all mouse events within the text view to the input server.

- (BOOL)wantsToHandleMouseEvents

**Discussion**

If the server needs to implement the `NSInputServerMouseTracker` protocol, return YES.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [wantsToHandleMouseEvents](#) (page 1411) (`NSInputManager`)

**Declared In**

`NSInputServer.h`

## wantsToInterpretAllKeystrokes

Returns YES if the server wants all keystrokes to be sent to it as characters.

- (BOOL)wantsToInterpretAllKeystrokes

### Discussion

If this method returns NO, control key combinations and function keys (the arrow keys, PageDown, F5, and so on) are delivered to the input server via the key binding mechanism and [doCommandBySelector:client:](#) (page 3539).

The Unicode values for the characters representing keyboard function keys (the arrow keys, PageDown, F5, and so on) names like `NSUpArrowFunctionKey`, and are documented in `NSEvent`. Control-key combinations are the usual ASCII control character codes.

For more information on key bindings, see “About Key Bindings”.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [wantsToInterpretAllKeystrokes](#) (page 1411) (`NSInputManager`)

### Declared In

`NSInputServer.h`

## Overview

The `NSKeyValueBindingCreation` informal protocol provides methods to create and remove bindings between view objects and controllers or controllers and model objects. In addition, it provides a means for a view subclass to advertise the bindings that it exposes. This informal protocol is implemented by `NSObject` and its methods can be overridden by view and controller subclasses.

When a new binding is created it relates the receiver's binding (for example, a property of the view object) to a property of the observable object specified by a key path. When the value of the specified property of the observable object changes, the receiver is notified using the key-value observing mechanism. A binding also specifies binding options that can further customize how the observing and the observed objects interact.

Bindings are considered to be a property of the object which is bound, and all information related to bindings should be retained by the object. All standard bindings on UIKit objects (views, cells, table columns, controllers) unbind their bindings automatically when they are released, but if you create key-value bindings for other kind of objects, you need to make sure that you remove those bindings when you release them (observed objects don't retain their observers, so controllers/model objects might continue referencing and messaging the objects that was bound to them).

Bindings between objects are typically established in Interface Builder using the Bindings inspector. However, there are times it must be done programmatically, such as when establishing a binding between objects in different nib files.

`NSView` subclasses can expose additional key-value-coding/key-value-observing compliant properties as bindings by calling the class method `exposeBinding:` (page 3546) for each of the properties. This is typically done in the class's `initialize` method. By exposing the bindings that an object supports and creating an Interface Builder palette, you can make instances of your own classes bindable in Interface Builder.

## Tasks

### Exposing Bindings

- + `exposeBinding:` (page 3546)  
Exposes the specified *binding*, advertising its availability.
- `exposedBindings` (page 3547)  
Returns an array containing the bindings exposed by the receiver.

### Managing Bindings

- `valueClassForBinding:` (page 3549)  
Returns the class of the value that will be returned for the specified binding.
- `bind:toObject:withKeyPath:options:` (page 3547)  
Establishes a binding between a given property of the receiver and the property of a given object specified by a given key path.
- `optionDescriptionsForBinding:` (page 3548)  
Returns an array describing the options for the specified binding.
- `infoForBinding:` (page 3548)  
Returns a dictionary describing the receiver's *binding*.
- `unbind:` (page 3549)  
Removes a given binding between the receiver and a controller.

## Class Methods

### **exposeBinding:**

Exposes the specified *binding*, advertising its availability.

```
+ (void)exposeBinding:(NSString *)binding
```

#### **Parameters**

*binding*

The key path for the property to be exposed.

#### **Discussion**

The bound property will be accessed using key-value-coding compliant methods. This method is typically invoked in the class's `initialize` implementation.

Bindings exposed using `exposeBinding` will be exposed automatically in `exposedBindings` (page 3547) unless that method explicitly filters them out, for example in subclasses.

#### **Availability**

Available in Mac OS X v10.3 and later.

**Declared In**

NSKeyValueBinding.h

## Instance Methods

### **bind:toObject:withKeyPath:options:**

Establishes a binding between a given property of the receiver and the property of a given object specified by a given key path.

```
- (void)bind:(NSString *)binding
 toObject:(id)observableController
 withKeyPath:(NSString *)keyPath
 options:(NSDictionary *)options
```

**Parameters***binding*

The key path for a property of the receiver previously exposed using the [exposeBinding:](#) (page 3546) method.

*observableController*

The bound-to object.

*keyPath*

A key path to a property reachable from *observableController*. The elements in the path must be key-value observing compliant (see *Key-Value Observing Programming Guide*).

*options*

A dictionary containing options for the binding, such as placeholder objects or an `NSValueTransformer` identifier as described in [“Constants”](#) (page 3550). This value is optional—pass `nil` to specify no options.

**Availability**

Available in Mac OS X v10.3 and later.

**See Also**

– [unbind:](#) (page 3549)

**Related Sample Code**

Simple Bindings Adoption

**Declared In**

NSKeyValueBinding.h

### **exposedBindings**

Returns an array containing the bindings exposed by the receiver.

```
- (NSArray *)exposedBindings
```

**Return Value**

An array containing the bindings exposed by the receiver.

**Discussion**

A subclass can override this method to remove bindings that are exposed by a superclass that are not appropriate for the subclass.

**Availability**

Available in Mac OS X v10.3 and later.

**See Also**

+ [exposeBinding:](#) (page 3546)

**Declared In**

NSKeyValueBinding.h

**infoForBinding:**

Returns a dictionary describing the receiver's *binding*.

```
- (NSDictionary *)infoForBinding:(NSString *)binding
```

**Parameters**

*binding*

The name of a binding.

**Return Value**

A dictionary with information about *binding*, or *nil* if the binding is not bound. The dictionary contains three key/value pairs: `NSObservedObjectKey`: object bound, `NSObservedKeyPathKey`: key path bound, `NSOptionsKey`: dictionary with the options and their values for the bindings.

**Discussion**

This method is mostly for use by subclasses which want to analyze the existing bindings of an object.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

NSKeyValueBinding.h

**optionDescriptionsForBinding:**

Returns an array describing the options for the specified binding.

```
- (NSArray *)optionDescriptionsForBinding:(NSString *)binding
```

**Parameters**

*binding*

The name of a binding

**Return Value**

Returns an array of `NSAttributeDescription` that describe the options for *binding*.

**Discussion**

The `NSAttributeDescription` instances in the array are used by Interface Builder to build the options editor user interface of the bindings inspector.

- The option name displayed for the option in the bindings inspector is based on the value of the `NSAttributeDescription` `methodName`.
- The type of editor displayed for the option in the bindings inspector is based on the value of the `NSAttributeDescription` `attributeType`.
- The default value displayed in the bindings inspector for the option is based on the value of the `NSAttributeDescription` `defaultValue`.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

`NSKeyValueBinding.h`

**unbind:**

Removes a given binding between the receiver and a controller.

- (void)unbind:(NSString \*)*binding*

**Parameters**

*binding*

The name of a binding.

**Availability**

Available in Mac OS X v10.3 and later.

**See Also**

- [bind:toObject:withKeyPath:options:](#) (page 3547)

**Declared In**

`NSKeyValueBinding.h`

**valueClassForBinding:**

Returns the class of the value that will be returned for the specified binding.

- (Class)valueClassForBinding:(NSString \*)*binding*

**Parameters**

*binding*

The name of a binding.

**Return Value**

The class of the value that will be returned for *binding*.

**Discussion**

This method is used by Interface Builder to determine the appropriate transformers for a binding.

Implementation of this method is optional.

**Availability**

Available in Mac OS X v10.3 and later.

**Declared In**

NSKeyValueBinding.h

## Constants

### Binding Options

The following values are used as keys in the options dictionary passed to the `bind:toObject:withKeyPath:options:` (page 3547) method. These keys are also used in the dictionary returned as the `NSOptionsKey` value of `infoForBinding:` (page 3548). See the *Cocoa Bindings Reference* for more information.

```
NSString *NSAllowsEditingMultipleValuesSelectionBindingOption;
NSString *NSAllowsNullArgumentBindingOption;
NSString *NSAlwaysPresentsApplicationModalAlertsBindingOption;
NSString *NSConditionallySetsEditableBindingOption;
NSString *NSConditionallySetsEnabledBindingOption;
NSString *NSConditionallySetsHiddenBindingOption;
NSString *NSContinuouslyUpdatesValueBindingOption;
NSString *NSCreatesSortDescriptorBindingOption;
NSString *NSDeletesObjectsOnRemoveBindingsOption;
NSString *NSDisplayNameBindingOption;
NSString *NSDisplayPatternBindingOption;
NSString *NSContentPlacementTagBindingOption;
NSString *NSHandlesContentAsCompoundValueBindingOption;
NSString *NSInsertsNullPlaceholderBindingOption;
NSString *NSInvokesSeparatelyWithArrayObjectsBindingOption;
NSString *NSMultipleValuesPlaceholderBindingOption;
NSString *NSNoSelectionPlaceholderBindingOption;
NSString *NSNotApplicablePlaceholderBindingOption;
NSString *NSNullPlaceholderBindingOption;
NSString *NSRaisesForNotApplicableKeysBindingOption;
NSString *NSPredicateFormatBindingOption;
NSString *NSSelectorNameBindingOption;
NSString *NSSelectsAllWhenSettingContentBindingOption;
NSString *NSValidatesImmediatelyBindingOption;
NSString *NSValueTransformerNameBindingOption;
NSString *NSValueTransformerBindingOption;
```

**Constants**

`NSAllowsEditingMultipleValuesSelectionBindingOption`

An `NSNumber` object containing a Boolean value that determines if the binding allows editing when the value represents a multiple selection.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

`NSAllowsNullArgumentBindingOption`

An `NSNumber` object containing a Boolean value that determines if the argument bindings allows passing argument values of `nil`.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSConditionallySetsEditableBindingOption**

An `NSNumber` object containing a Boolean value that determines if the editable state of the user interface item is automatically configured based on the controller's selection.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSConditionallySetsEnabledBindingOption**

An `NSNumber` object containing a Boolean value that determines if the enabled state of the user interface item is automatically configured based on the controller's selection.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSConditionallySetsHiddenBindingOption**

An `NSNumber` object containing a Boolean value that determines if the hidden state of the user interface item is automatically configured based on the controller's selection.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSContentPlacementTagBindingOption**

An `NSNumber` object specifying the tag id of the popup menu item to replace with the content of the array. This allows you to use a popup menu that contains both static and bindings generated items.

Available in Mac OS X v10.5 and later.

Declared in `NSKeyValueBinding.h`.

**NSContinuouslyUpdatesValueBindingOption**

An `NSNumber` object containing a Boolean value that determines whether the value of the binding is updated as edits are made to the user interface item or is updated only when the user interface item resigns as the responder.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSCreatesSortDescriptorBindingOption**

An `NSNumber` object containing a Boolean value that determines if a sort descriptor is created for a table column.

If this value is NO, then the table column does not allow sorting.

Declared in `NSKeyValueBinding.h`.

Available in Mac OS X v10.4 and later.

**NSDeletesObjectsOnRemoveBindingsOption**

An `NSNumber` object containing a Boolean value that determines if an object is deleted from the managed context immediately upon being removed from a relationship.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSDisplayNameBindingOption**

An `NSString` object containing a human readable string to be displayed for a predicate.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSDisplayPatternBindingOption**

An NSString object that specifies a format string used to construct the final value of a string.

Available in Mac OS X v10.4 and later.

Declared in NSKeyValueBinding.h.

**NSHandlesContentAsCompoundValueBindingOption**

An NSNumber object containing a Boolean value that determines if the content is treated as a compound value.

Available in Mac OS X v10.4 and later.

Declared in NSKeyValueBinding.h.

**NSInsertsNullPlaceholderBindingOption**

An NSNumber object containing a Boolean value that determines if an additional item which represents nil is inserted into a matrix or pop-up menu before the items in the content array.

Available in Mac OS X v10.4 and later.

Declared in NSKeyValueBinding.h.

**NSInvokesSeparatelyWithArrayObjectsBindingOption**

An NSNumber object containing a Boolean value that determines whether the specified selector is invoked with the array as the argument or is invoked repeatedly with each array item as an argument.

Available in Mac OS X v10.4 and later.

Declared in NSKeyValueBinding.h.

**NSMultipleValuesPlaceholderBindingOption**

An object that is used as a placeholder when the key path of the bound controller returns the NSMultipleValuesMarker marker for a binding.

Available in Mac OS X v10.4 and later.

Declared in NSKeyValueBinding.h.

**NSNoSelectionPlaceholderBindingOption**

An object that is used as a placeholder when the key path of the bound controller returns the NSNoSelectionMarker marker for a binding.

Available in Mac OS X v10.4 and later.

Declared in NSKeyValueBinding.h.

**NSNotApplicablePlaceholderBindingOption**

An object that is used as a placeholder when the key path of the bound controller returns the NSNotApplicableMarker marker for a binding.

Available in Mac OS X v10.4 and later.

Declared in NSKeyValueBinding.h.

**NSNullPlaceholderBindingOption**

An object that is used as a placeholder when the key path of the bound controller returns nil for a binding.

Available in Mac OS X v10.4 and later.

Declared in NSKeyValueBinding.h.

**NSPredicateFormatBindingOption**

An NSString object containing the predicate pattern string for the predicate bindings. Use \$value to refer to the value in the search field.

Available in Mac OS X v10.4 and later.

Declared in NSKeyValueBinding.h.

**NSRaisesForNotApplicableKeysBindingOption**

An `NSNumber` object containing a Boolean value that specifies if an exception is raised when the binding is bound to a key that is not applicable—for example when an object is not key-value coding compliant for a key.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSSelectorNameBindingOption**

An `NSString` object that specifies the method selector invoked by the target binding when the user interface item is clicked.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSSelectsAllWhenSettingContentBindingOption**

An `NSNumber` object containing a Boolean value that specifies if all the items in the array controller are selected when the content is set.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSValidatesImmediatelyBindingOption**

An `NSNumber` object containing a Boolean value that determines if the contents of the binding are validated immediately.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSValueTransformerNameBindingOption**

The value for this key is an identifier of a registered `NSValueTransformer` instance that is applied to the bound value.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSValueTransformerBindingOption**

An `NSValueTransformer` instance that is applied to the bound value.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**Declared In**

`NSKeyValueBindingCreation.h`

## Binding Dictionary Keys

The following values are used as keys in the dictionary returned by `infoForBinding:` (page 3548)

```
NSString *NSObservedObjectKey;
NSString *NSObservedKeyPathKey;
NSString *NSOptionsKey;
```

**Constants****NSObservedObjectKey**

The object that is the observable controller of the binding.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

`NSObservedKeyPathKey`

An `NSString` object containing the key path of the binding.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

`NSOptionsKey`

An `NSDictionary` object containing key value pairs as specified in the options dictionary when the binding was created.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**Declared In**

`NSKeyValueBindingCreation.h`

## Bindings

The following values are used to specify a binding to `bind:toObject:withKeyPath:options:` (page 3547), `infoForBinding:` (page 3548), `unbind:` (page 3549) and `valueClassForBinding:` (page 3549). See *Cocoa Bindings Reference* for more information.

### Constants

NSAlignmentBinding

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

NSAlternateImageBinding

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

NSAlternateTitleBinding

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

NSAnimateBinding

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

NSAnimationDelayBinding

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

NSArgumentBinding

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSAttributedStringBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSContentArrayBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSContentArrayForMultipleSelectionBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSContentBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSContentHeightBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSContentObjectBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSContentObjectsBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSContentSetBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSContentValuesBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSContentWidthBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSCriticalValueBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSDataBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSDisplayPatternTitleBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSDisplayPatternValueBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSDocumentEditedBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSEditableBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSEnabledBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSFontBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSFontBoldBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSFontFamilyNameBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSFontItalicBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSFontNameBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSFontSizeBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSHeaderTitleBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSHiddenBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSImageBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSIsIndeterminateBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSLabelBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSManagedObjectContextBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSMaxValueBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSMaxWidthBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSMinValueBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSMinWidthBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSMixedStateImageBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSOffStateImageBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSOnStateImageBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSPredicateBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSRecentSearchesBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSRepresentedFilenameBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSRowHeightBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

`NSSelectedIdentifierBinding`

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

`NSSelectedIndexBinding`

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

`NSSelectedLabelBinding`

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

`NSSelectedObjectBinding`

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

`NSSelectedObjectsBinding`

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

`NSSelectedTagBinding`

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

`NSSelectedValueBinding`

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

`NSSelectedValuesBinding`

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

`NSSelectionIndexesBinding`

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

`NSSelectionIndexPathsBinding`

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSSortDescriptorsBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSTargetBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSTextColorBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSTitleBinding**

See *Cocoa Bindings Reference* for more information.

Available in Mac OS X v10.4 and later.

Declared in `NSKeyValueBinding.h`.

**NSToolTipBinding**

See *Cocoa Bindings Reference* for more information.

# NSMenuValidation Protocol Reference

(informal protocol)

---

|                        |                                                               |
|------------------------|---------------------------------------------------------------|
| <b>Framework</b>       | /System/Library/Frameworks/AppKit.framework                   |
| <b>Declared in</b>     | AppKit/NSMenu.h                                               |
| <b>Companion guide</b> | Application Menu and Pop-up List Programming Topics for Cocoa |

## Overview

This informal protocol allows your application to update the enabled or disabled status of an `NSMenuItem` object. It declares only one method, `validateMenuItem:` (page 3565).

## Tasks

### Validating Menu Items

- `validateMenuItem:` (page 3565)  
Implemented to override the default action of enabling or disabling a specific menu item.

## Instance Methods

### **validateMenuItem:**

Implemented to override the default action of enabling or disabling a specific menu item.

```
- (BOOL)validateMenuItem:(NSMenuItem *)menuItem
```

#### **Parameters**

*menuItem*

An `NSMenuItem` object that represents the menu item.

#### **Return Value**

YES to enable *menuItem*, NO to disable it.

#### **Discussion**

The object implementing this method must be the target of *menuItem*. You can determine which menu item *menuItem* is by querying it for its tag or action.

The following example disables the menu item associated with the `nextRecord` action method when the selected line in a table view is the last one; conversely, it disables the menu item with `priorRecord` as its action method when the selected row is the first one in the table view. (The `countryKeys` array contains names that appear in the table view.)

```
- (BOOL)validateMenuItem:(NSMenuItem *)item {
 int row = [tableView selectedRow];
 if ([item action] == @selector(nextRecord) &&
 (row == [countryKeys indexOfObject:[countryKeys lastObject]])) {
 return NO;
 }
 if ([item action] == @selector(priorRecord) && row == 0) {
 return NO;
 }
 return YES;
}
```

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSMenu.h

# NSNibAwaking Protocol Reference

(informal protocol)

---

|                        |                                             |
|------------------------|---------------------------------------------|
| <b>Framework</b>       | /System/Library/Frameworks/AppKit.framework |
| <b>Declared in</b>     | AppKit/NSNibLoading.h                       |
| <b>Companion guide</b> | Resource Programming Guide                  |

## Overview

This informal protocol consists of a single method, [awakeFromNib](#) (page 3567). Classes can implement this method to initialize state information after objects have been loaded from an Interface Builder archive (nib file).

## Tasks

### Responding to Being Loaded from a Nib File

- [awakeFromNib](#) (page 3567)

Prepares the receiver for service after it has been loaded from an Interface Builder archive, or nib file.

## Instance Methods

### awakeFromNib

Prepares the receiver for service after it has been loaded from an Interface Builder archive, or nib file.

- (void)awakeFromNib

#### Discussion

An [awakeFromNib](#) message is sent to each object loaded from the archive, but only if it can respond to the message, and only after all the objects in the archive have been loaded and initialized. When an object receives an [awakeFromNib](#) message, it is guaranteed to have all its outlet instance variables set.

**Note:** During Interface Builder’s test mode, this method is also sent to objects instantiated from loaded palettes, which include executable code for the objects. It is not sent to objects created using the Classes display of the nib file window in Interface Builder.

During the instantiation process, each object in the archive is unarchived and then initialized with the method befitting its type. Cocoa views (and custom views that can be customized using an associated Interface Builder palette) are initialized using their `initWithCoder:` method. Custom views are initialized using their `initWithFrame:` method. Custom classes that have been instantiated in the nib are initialized using their `init` method.

Once all objects have been instantiated and initialized from the archive, the nib loading code attempts to reestablish the connections between each object’s outlets and the corresponding target objects. If your custom objects have outlets, an `NSNib` object attempts to reestablish any connections you created in Interface Builder. It starts by trying to establish the connections using your object’s own methods first. For each outlet that needs a connection, the `NSNib` object looks for a method of the form `setOutletName:` in your object. If that method exists, the `NSNib` object calls it, passing the target object as a parameter. If you did not define a setter method with that exact name, the `NSNib` object searches the object for an instance variable (of type `IBOutlet id`) with the corresponding outlet name and tries to set its value directly. If an instance variable with the correct name cannot be found, initialization of that connection does not occur. Finally, after all the objects are fully initialized, each receives an `awakeFromNib` message.

**Important:** Because the order in which objects are instantiated from an archive is not guaranteed, your initialization methods should not send messages to other objects in the hierarchy. Messages to other objects can be sent safely from within `awakeFromNib`—by which time it’s assured that all the objects are unarchived and initialized (though not necessarily awakened, of course).

Typically, you implement `awakeFromNib` for the class you associate with the “File’s Owner” of the nib file. You might also want to implement this method for any other classes you instantiate directly in your nib file. The job of these objects is to give you a hook for connecting the nib file objects to other objects in your application. Once that job is finished, you can either dispose of the objects or use them as a controller for the nib file objects.

An example of how you might use `awakeFromNib` is shown below. Suppose your nib file has two custom views that must be positioned relative to each other at runtime. Trying to position them at initialization time might fail because the other view might not yet be unarchived and initialized yet. However, you can position both of them in the nib file owner’s `awakeFromNib` method. In the code below, `firstView` and `secondView` are outlets of the file’s owner:

```
- (void)awakeFromNib {
 NSRect viewFrame;

 viewFrame = [firstView frame];
 viewFrame.origin.x += viewFrame.size.width;
 [secondView setFrame:viewFrame];
 return;
}
```

It is recommended that you maintain a one-to-one correspondence between your File’s Owner objects and their associated nib files. Loading two nib files with the same File’s Owner object causes that object’s `awakeFromNib` method being called twice, which could cause some data structures to be reinitialized in undesired ways. It is also recommended that you avoid loading other nib files from your `awakeFromNib` method implementation.

You should call the `super` implementation of `awakeFromNib` only if you know for certain that your superclass provides an implementation. Because the Application Kit does not provide a default implementation of the `awakeFromNib` method, calling `super` results in an exception if the parent class does not implement it. Classes whose immediate parent class is `NSObject` or `NSView` do not need to call the `super` implementation. For any other classes, you can use the `instancesRespondToSelector:` class method of `NSObject` to determine if the parent class responds to `awakeFromNib` and call the method if it does.

**Availability**

Available in Mac OS X v10.0 and later.

# NSOutlineViewDataSource Protocol Reference

(informal protocol)

---

|                        |                                             |
|------------------------|---------------------------------------------|
| <b>Framework</b>       | /System/Library/Frameworks/AppKit.framework |
| <b>Declared in</b>     | AppKit/NSOutlineView.h                      |
| <b>Companion guide</b> | Outline View Programming Topics for Cocoa   |

## Overview

NSOutlineView objects support a data source delegate in addition to the regular delegate object. The `NSOutlineViewDataSource` protocol defines methods that the outline view invokes as necessary to retrieve data and information about the data from the data source delegate, and—optionally—to update data values.

The regular delegate object handles all other delegate responsibilities for the outline view.

You must implement the basic methods that provide the outline view with data: `outlineView:child:ofItem:` (page 3573), `outlineView:isItemExpandable:` (page 3574), `outlineView:numberOfChildrenOfItem:` (page 3575), and `outlineView:objectValueForTableColumn:byItem:` (page 3576). If you want to allow the user to edit values, you must implement `outlineView:setObjectValue:forTableColumn:byItem:` (page 3577). When these methods are invoked by the table view, `nil` as the *item* refers to the “root” item. NSOutlineView requires that each item in the outline view be unique. In order for the collapsed state of an outline view to remain consistent between reloads you must always return the same object for an item.

**Note:** Some of the methods in this protocol, such as `outlineView:child:ofItem:` (page 3573) and `outlineView:numberOfChildrenOfItem:` (page 3575) along with other methods that return data, are called very frequently, so they must be efficient.

## Tasks

### Working with Items in a View

- `outlineView:child:ofItem:` (page 3573)  
Returns the child item at the specified index of a given item.
- `outlineView:isItemExpandable:` (page 3574)  
Returns a Boolean value that indicates whether in a given item is expandable.
- `outlineView:numberOfChildrenOfItem:` (page 3575)  
Returns the number of child items encompassed by a given item.

- `outlineView:objectValueForTableColumn:byItem:` (page 3576)  
Invoked by *outlineView* to return the data object associated with the specified *item*.
- `outlineView:setObjectValue:forTableColumn:byItem:` (page 3577)  
Set the data object for a given item in a given column.

## Supporting Drag and Drop

- `outlineView:acceptDrop:item:childIndex:` (page 3572)  
Returns a Boolean value that indicates whether a drop operation was successful.
- `outlineView:validateDrop:proposedItem:proposedChildIndex:` (page 3578)  
Used by an outline view to determine a valid drop target.
- `outlineView:namesOfPromisedFilesDroppedAtDestination:forDraggedItems:` (page 3575)  
Returns an array of filenames for the created files that the receiver promises to create.

## Supporting Object Persistence

- `outlineView:itemForPersistentObject:` (page 3574)  
Invoked by *outlineView* to return the item for the archived *object*.
- `outlineView:persistentObjectForItem:` (page 3577)  
Invoked by *outlineView* to return an archived object for *item*.

## Working with a Pasteboard

- `outlineView:writeItems:toPasteboard:` (page 3579)  
Returns a Boolean value that indicates whether a drag operation is allowed.

## Sorting

- `outlineView:sortDescriptorsDidChange:` (page 3578)  
Invoked by an outline view to notify the data source that the descriptors changed and the data may need to be resorted.

# Instance Methods

## **outlineView:acceptDrop:item:childIndex:**

Returns a Boolean value that indicates whether a drop operation was successful.

- (BOOL)outlineView:(NSOutlineView \*)outlineView acceptDrop:(id < NSDraggingInfo >)info item:(id)item childIndex:(NSInteger)index

**Parameters***outlineView*

The outline view that sent the message. *outlineView* must have previously allowed a drop.

*info*

An object that contains more information about this dragging operation.

*item*

The parent of the item over which the cursor was placed when the mouse button was released.

*index*

The index of the child of *item* over which the cursor was placed when the mouse button was released.

**Return Value**

YES if the drop operation was successful, otherwise NO.

**Discussion**

The data source should incorporate the data from the dragging pasteboard in the implementation of this method. You can get the data for the drop operation from *info* using the [draggingPasteboard](#) (page 3506) method.

The return value indicates success or failure of the drag operation to the system.

Implementation of this method is optional.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [shouldCollapseAutoExpandedItemsForDeposited:](#) (page 1829)

**Declared In**

NSOutlineView.h

**outlineView:child:ofItem:**

Returns the child item at the specified index of a given item.

```
- (id)outlineView:(NSOutlineView *)outlineView child:(NSInteger)index ofItem:(id)item
```

**Parameters***outlineView*

The outline view that sent the message.

*index*

The index of the child item from *item* to return.

*item*

An item in the data source.

**Return Value**

The child item at *index* of a *item*. If *item* is nil, returns the appropriate child item of the root object.

**Discussion**

Children of a given parent *item* are accessed sequentially. In order for the collapsed state of the outline view to remain consistent when it is reloaded you must always return the same object for a specified *child* and *item*.

**Special Considerations**

You must implement this method.

`outlineView:child:ofItem:` is called very frequently, so it must be efficient.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [outlineView:numberOfChildrenOfItem:](#) (page 3575)

**Declared In**

NSOutlineView.h

**outlineView:isItemExpandable:**

Returns a Boolean value that indicates whether in a given item is expandable.

– (BOOL)outlineView:(NSOutlineView \*)*outlineView* isItemExpandable:(id)*item*

**Parameters**

*outlineView*

The outline view that sent the message.

*item*

An item in the data source.

**Return Value**

YES if *item* can be expanded to display its children, otherwise NO.

**Special Considerations**

You must implement this method.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSOutlineView.h

**outlineView:itemForPersistentObject:**

Invoked by *outlineView* to return the item for the archived *object*.

– (id)outlineView:(NSOutlineView \*)*outlineView* itemForPersistentObject:(id)*object*

**Parameters**

*outlineView*

The outline view that sent the message.

*object*

An archived representation of an item in *outlineView*'s data source.

**Return Value**

The unarchived item corresponding to *object*. If the item is an archived object, this method may return the object.

**Discussion**

When the outline view is restoring the saved expanded items, this method is called for each expanded item, to translate the archived object to an outline view item.

**Special Considerations**

You must implement this method if you are automatically saving expanded items (that is, if [autosaveExpandedItems](#) (page 1817) returns YES).

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSOutlineView.h

**outlineView:namesOfPromisedFilesDroppedAtDestination:forDraggedItems:**

Returns an array of filenames for the created files that the receiver promises to create.

```
- (NSArray *)outlineView:(NSOutlineView *)outlineView
 namesOfPromisedFilesDroppedAtDestination:(NSURL *)dropDestination
 forDraggedItems:(NSArray *)items
```

**Parameters**

*outlineView*

The outline view that sent the message.

*dropDestination*

The drop location where the files are created.

*items*

The items being dragged.

**Return Value**

An array of filenames (not full paths) for the created files that the receiver promises to create.

**Discussion**

For more information on file promise dragging, see documentation on the [NSDraggingSource](#) protocol and [namesOfPromisedFilesDroppedAtDestination:](#) (page 3515).

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

NSOutlineView.h

**outlineView:numberOfChildrenOfItem:**

Returns the number of child items encompassed by a given item.

```
- (NSInteger)outlineView:(NSOutlineView *)outlineView numberOfChildrenOfItem:(id)item
```

**Parameters***outlineView*

The outline view that sent the message.

*item*

An item in the data source.

**Return Value**

The number of child items encompassed by *item*. If *item* is `nil`, this method should return the number of children for the top-level item.

**Special Considerations**

You must implement this method.

`outlineView:numberOfChildrenOfItem:` is called very frequently, so it must be efficient.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSOutlineView.h

**outlineView:objectValueForTableColumn:byItem:**

Invoked by *outlineView* to return the data object associated with the specified *item*.

```
- (id)outlineView:(NSOutlineView *)outlineView
 objectValueForTableColumn:(NSTableColumn *)tableColumn byItem:(id)item
```

**Parameters***outlineView*

The outline view that sent the message.

*tableColumn*A column in *outlineView*.*item*An item in the data source in the specified *tableColumn* of the view.**Discussion**

The item is located in the specified *tableColumn* of the view.

**Special Considerations**

You must implement this method.

NSOutlineView requires that each item in the outline view be unique. In order for the collapsed state of the outline view to remain consistent when it is reloaded you must always return the same object for the specified *item*.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSOutlineView.h

## outlineView:persistentObjectForItem:

Invoked by *outlineView* to return an archived object for *item*.

```
- (id)outlineView:(NSOutlineView *)outlineView persistentObjectForItem:(id)item
```

### Parameters

*outlineView*

The outline view that sent the message.

*item*

The item for which to return an archived object.

### Return Value

An archived representation of *item*. If the item is an archived object, this method may return the item.

### Discussion

When the outline view is saving the expanded items, this method is called for each expanded item, to translate the outline view item to an archived object.

### Special Considerations

You must implement this method if you are automatically saving expanded items (that is, if [autosaveExpandedItems](#) (page 1817) returns YES).

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

NSOutlineView.h

## outlineView:setObjectValue:forTableColumn:byItem:

Set the data object for a given item in a given column.

```
- (void)outlineView:(NSOutlineView *)outlineView setObjectValue:(id)object
forTableColumn:(NSTableColumn *)tableColumn byItem:(id)item
```

### Parameters

*outlineView*

The outline view that sent the message.

*object*

The new value for the item.

*tableColumn*

A column in *outlineView*.

*item*

An item in the data source in the specified *tableColumn* of the view.

### Discussion

Implementation of this method is optional.

### Availability

Available in Mac OS X v10.0 and later.

**Declared In**

NSOutlineView.h

**outlineView:sortDescriptorsDidChange:**

Invoked by an outline view to notify the data source that the descriptors changed and the data may need to be resorted.

```
- (void)outlineView:(NSOutlineView *)outlineView sortDescriptorsDidChange:(NSArray *)oldDescriptors
```

**Parameters***outlineView*

The outline view that sent the message.

*oldDescriptors*

An array that contains the previous descriptors.

**Discussion**

The data source typically sorts and reloads the data, and adjusts the selections accordingly. If you need to know the current sort descriptors and the data source does not itself manage them, you can get *outlineView*'s current sort descriptors by sending it a [sortDescriptors](#) (page 2615) message.

Implementation of this method is optional.

**Availability**

Available in Mac OS X v10.3 and later.

**Declared In**

NSOutlineView.h

**outlineView:validateDrop:proposedItem:proposedChildIndex:**

Used by an outline view to determine a valid drop target.

```
- (NSDragOperation)outlineView:(NSOutlineView *)outlineView validateDrop:(id < NSDraggingInfo >)info proposedItem:(id)item proposedChildIndex:(NSInteger)index
```

**Parameters***outlineView*

The outline view that sent the message.

*info*

An object that contains more information about this dragging operation.

*item*

The proposed parent.

*index*

The proposed child location.

**Return Value**

A value that indicates which dragging operation the data source will perform.

**Discussion**

Based on the mouse position, the outline view will suggest a proposed drop location. The data source may “retarget” a drop if desired by calling `setDropItem:dropChildIndex:` (page 1827) and returning something other than `NSDragOperationNone`. You may choose to retarget for various reasons (for example, for better visual feedback when inserting into a sorted position).

Implementation of this method is optional.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSOutlineView.h

**outlineView:writeItems:toPasteboard:**

Returns a Boolean value that indicates whether a drag operation is allowed.

```
- (BOOL)outlineView:(NSOutlineView *)outlineView writeItems:(NSArray *)items
toPasteboard:(NSPasteboard *)pboard
```

**Parameters**

*outlineView*

The outline view that invoked the method.

*items*

An array of the items participating in the drag.

*pboard*

The pasteboard to which to write the drag data.

**Return Value**

YES if the drag operation is allowed, otherwise NO.

**Discussion**

Invoked by *outlineView* after it has been determined that a drag should begin, but before the drag has been started.

To refuse the drag, return NO. To start a drag, return YES and place the drag data onto the *pboard* (data, owner, and so on). The drag image and other drag-related information will be set up and provided by the outline view once this call returns with YES.

Implementation of this method is optional.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSOutlineView.h

# NSPathCellDelegate Protocol Reference

---

|                     |                                             |
|---------------------|---------------------------------------------|
| <b>Conforms to</b>  | NSObject                                    |
| <b>Framework</b>    | /System/Library/Frameworks/AppKit.framework |
| <b>Availability</b> | Available in Mac OS X v10.5 and later.      |
| <b>Declared in</b>  | AppKit/NSPathCell.h                         |

## Overview

The `NSPathCellDelegate` optional protocol enables the delegate of an `NSPathCell` object to customize the Open panel or pop-up menu of a path whose style is set to [NSPathStylePopUp](#) (page 1912).

## Tasks

### Customizing the Open Panel

- [pathCell:willDisplayOpenPanel:](#) (page 3581)  
Implement this method to customize the Open panel shown by a pop-up-style path.

### Customizing the Menu

- [pathCell:willPopUpMenu:](#) (page 3582)  
Implement this method to customize the menu of a pop-up-style path.

## Instance Methods

### **pathCell:willDisplayOpenPanel:**

Implement this method to customize the Open panel shown by a pop-up-style path.

- (void)pathCell:(NSPathCell \*)pathCell  
willDisplayOpenPanel:(NSOpenPanel \*)openPanel

**Parameters***pathCell*

The path cell that sent the message.

*openPanel*

The Open panel to be displayed.

**Discussion**

This method is called before the Open panel is shown but after its allowed file types are set to the cell's allowed types. At this time, you can further customize the Open panel as required. This method is called only when the style is set to `NSPathStylePopUp`. Implementation of this method is optional.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

`NSPathCell.h`

**pathCell:willPopUpMenu:**

Implement this method to customize the menu of a pop-up-style path.

```
- (void)pathCell:(NSPathCell *)pathCell
 willPopUpMenu:(NSMenu *)menu
```

**Parameters***pathCell*

The path cell that sent the message.

*menu*

The pop-up menu to be displayed.

**Discussion**

This method is called before the pop-up menu is shown. At this time, you can further customize the menu as required, adding and removing items. This method is called only when the style is set to `NSPathStylePopUp`. Implementation of this method is optional.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

`NSPathCell.h`

# NSPathControlDelegate Protocol Reference

---

|                     |                                             |
|---------------------|---------------------------------------------|
| <b>Conforms to</b>  | NSObject                                    |
| <b>Framework</b>    | /System/Library/Frameworks/AppKit.framework |
| <b>Availability</b> | Available in Mac OS X v10.5 and later.      |
| <b>Declared in</b>  | AppKit/NSPathControl.h                      |

## Overview

The `NSPathControlDelegate` optional protocol is implemented by the delegate of an `NSPathControl` object to support dragging to and from the control.

## Tasks

### Dragging Support

- [pathControl:shouldDragPathComponentCell:withPasteboard:](#) (page 3584)  
Implement this method to enable dragging from the control.
- [pathControl:validateDrop:](#) (page 3585)  
Implement this method to enable dragging onto the control.
- [pathControl:acceptDrop:](#) (page 3584)  
Implement this method to accept previously validated contents dropped onto the control.

### Customizing a Pop-Up–Style Path

- [pathControl:willDisplayOpenPanel:](#) (page 3585)  
Implement this method to customize the Open panel shown by a pop-up–style path.
- [pathControl:willPopUpMenu:](#) (page 3586)  
Implement this method to customize the menu of a pop-up–style path.

## Instance Methods

### **pathControl:acceptDrop:**

Implement this method to accept previously validated contents dropped onto the control.

```
- (BOOL)pathControl:(NSPathControl *)pathControl
 acceptDrop:(id <NSDraggingInfo>)info
```

#### **Parameters**

*pathControl*

The path control that sent the message.

*info*

An object containing details about this dragging operation.

#### **Discussion**

In order to accept the dropped contents previously accepted from [pathControl:validateDrop:](#) (page 3585), you must implement this method. This method is called from [performDragOperation:](#) (page 3501). You should change the URL value based on the dragged information.

If not implemented, and the control's cell is editable, the drop is accepted if it contains an `NSURLPboardType` or `NSFilenamesPboardType` that conforms to the cell's allowed types. The cell's URL value is automatically changed, and the action is invoked. Implementation of this method is optional.

#### **Availability**

Available in Mac OS X v10.5 and later.

#### **Declared In**

`NSPathControl.h`

### **pathControl:shouldDragPathComponentCell:withPasteboard:**

Implement this method to enable dragging from the control.

```
- (BOOL)pathControl:(NSPathControl *)pathControl
 shouldDragPathComponentCell:(NSPathComponentCell *)pathComponentCell
 withPasteboard:(NSPasteboard *)pasteboard
```

#### **Parameters**

*pathControl*

The path control that sent the message.

*pathComponentCell*

The path component cell from which the drag is beginning.

*pasteboard*

The pasteboard.

**Discussion**

This method is called when a drag is about to begin. You can refuse to allow the drag to happen by returning `NO` and allow it by returning `YES`. By default, the pasteboard automatically has the following types on it: `NSStringPboardType`, `NSURLPboardType` (if there is a URL value for the cell being dragged), and `NSFileNamesPboardType` (if the URL value returns `YES` from `-isFileURL`). You can customize the types placed on the pasteboard at this time, if desired. Implementation of this method is optional.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

`NSPathControl.h`

**pathControl:validateDrop:**

Implement this method to enable dragging onto the control.

```
- (NSDragOperation)pathControl:(NSPathControl *)pathControl
 validateDrop:(id <NSDraggingInfo>)info
```

**Parameters**

*pathControl*

The path control that sent the message.

*info*

An object containing details about this dragging operation.

**Discussion**

This method is called when something is dragged over the control. Return `NSDragOperationNone` to refuse the drop, or return anything else to accept it.

If not implemented, and the control's cell is editable, the drop is accepted if it contains an `NSURLPboardType` or `NSFileNamesPboardType` that conforms to the cell's allowed types. Implementation of this method is optional.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

`NSPathControl.h`

**pathControl:willDisplayOpenPanel:**

Implement this method to customize the Open panel shown by a pop-up-style path.

```
- (void)pathControl:(NSPathControl *)pathControl
 willDisplayOpenPanel:(NSOpenPanel *)openPanel
```

**Parameters**

*pathControl*

The path control displaying the Open panel.

*openPanel*

The Open panel to be displayed.

**Discussion**

This method is called before the Open panel is shown but after its allowed file types are set to the cell's allowed types. At this time, you can further customize the Open panel as required. This method is called only when the style is set to `NSPathStylePopUp`. Implementation of this method is optional.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

`NSPathControl.h`

**pathControl:willPopUpMenu:**

Implement this method to customize the menu of a pop-up-style path.

```
- (void)pathControl:(NSPathControl *)pathControl
 willPopUpMenu:(NSMenu *)menu
```

**Parameters**

*pathControl*

The path control displaying the pop-up menu.

*menu*

The pop-up menu to be displayed.

**Discussion**

This method is called before the pop-up menu is shown. At this time, you can further customize the menu as required, adding and removing items. This method is called only when the style is set to `NSPathStylePopUp`. Implementation of this method is optional.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

`NSPathControl.h`

# NSPlaceholders Protocol Reference

(informal protocol)

---

|                        |                                             |
|------------------------|---------------------------------------------|
| <b>Framework</b>       | /System/Library/Frameworks/AppKit.framework |
| <b>Declared in</b>     | AppKit/NSKeyValueBinding.h                  |
| <b>Availability</b>    | Available in Mac OS X v10.3 and later.      |
| <b>Companion guide</b> | Cocoa Bindings Programming Topics           |

## Overview

The `NSPlaceholders` protocol provides an interface that allows an object to register default placeholders that will be displayed for a binding, when no other placeholder has been specified. Individual placeholder values can be specified for each of the marker objects (described in “[Selection Markers](#)” (page 3588)), as well as when the property is `nil`.

Placeholders are used when a property of an instance of the receiving class is accessed through a key value coding compliant method, and returns `nil` or a specialized marker.

## Tasks

### Managing Default Placeholders

+ [setDefaultPlaceholder:forMarker:withBinding:](#) (page 3588)

Sets *placeholder* as the default placeholder for the *binding*, when a key value coding compliant property of an instance of the receiving class returns the value specified by *marker*, and no other placeholder has been specified.

+ [defaultPlaceholderForMarker:withBinding:](#) (page 3588)

Returns an object that will be used as the placeholder for the *binding*, when a key value coding compliant property of an instance of the receiving class returns the value specified by *marker*, and no other placeholder has been specified.

## Class Methods

### defaultPlaceholderForMarker:withBinding:

Returns an object that will be used as the placeholder for the *binding*, when a key value coding compliant property of an instance of the receiving class returns the value specified by *marker*, and no other placeholder has been specified.

```
+ (id)defaultPlaceholderForMarker:(id)marker withBinding:(NSString *)binding
```

#### Discussion

The *marker* can be `nil` or one of the constants described in “[Selection Markers](#)” (page 3588).

#### Availability

Available in Mac OS X v10.3 and later.

#### See Also

+ [setDefaultPlaceholder:forMarker:withBinding:](#) (page 3588)

#### Declared In

NSKeyValueBinding.h

### setDefaultPlaceholder:forMarker:withBinding:

Sets *placeholder* as the default placeholder for the *binding*, when a key value coding compliant property of an instance of the receiving class returns the value specified by *marker*, and no other placeholder has been specified.

```
+ (void)setDefaultPlaceholder:(id)placeholder forMarker:(id)marker
 withBinding:(NSString *)binding
```

#### Discussion

The *marker* can be `nil` or one of the constants described in “[Selection Markers](#)” (page 3588).

#### Availability

Available in Mac OS X v10.3 and later.

#### See Also

+ [defaultPlaceholderForMarker:withBinding:](#) (page 3588)

#### Declared In

NSKeyValueBinding.h

## Constants

### Selection Markers

The following constants are used to describe special cases for a controller’s selection.

```
id NSMultipleValuesMarker;
id NSNoSelectionMarker;
id NSNotApplicableMarker;
```

**Constants****NSMultipleValuesMarker**

This marker indicates that a key's value contains multiple values that differ.

A binding can be configured to always return this marker for multiple items, even if the values are the same.

Available in Mac OS X v10.3 and later.

Declared in `NSKeyValueBinding.h`.

**NSNoSelectionMarker**

This marker indicates that the controller's selection is currently empty.

Available in Mac OS X v10.3 and later.

Declared in `NSKeyValueBinding.h`.

**NSNotApplicableMarker**

This marker indicates that an object is not key-value coding compliant for the requested key.

Available in Mac OS X v10.3 and later.

Declared in `NSKeyValueBinding.h`.

**Availability**

Available in Mac OS X v10.3 and later.

**Declared In**

`NSKeyValueBinding.h`

# NSPrintPanelAccessorizing Protocol Reference

---

|                     |                                             |
|---------------------|---------------------------------------------|
| <b>Framework</b>    | /System/Library/Frameworks/AppKit.framework |
| <b>Availability</b> | Available in Mac OS X v10.5 and later.      |
| <b>Declared in</b>  | AppKit/NSPrintPanel.h                       |

## Overview

The `NSPrintPanelAccessorizing` protocol declares two methods that the `NSPrintPanel` class uses to get information from a printing accessory controller.

A printing accessory controller manages a custom print panel accessory view and used to coordinate print settings. If you are implementing a custom printing accessory view, your controller must support this protocol. Implementation of only one method in the protocol is actually required. The other method is considered optional and is used to support the print panel's built-in preview facilities.

## Tasks

### Responding to Being Loaded from a Nib File

- [localizedSummaryItems](#) (page 3592)  
Returns an array of dictionaries containing the localized user setting summary strings.
- [keyPathsForValuesAffectingPreview](#) (page 3591)  
Returns a set of strings identifying the key paths for any properties that might affect the built-in print preview. (optional)

## Instance Methods

### keyPathsForValuesAffectingPreview

Returns a set of strings identifying the key paths for any properties that might affect the built-in print preview. (optional)

- (NSSet \*)keyPathsForValuesAffectingPreview

**Return Value**

A set of `NSString` objects identifying one or more key paths. Only key paths for properties that might affect the contents of the print preview should be returned.

**Discussion**

If an accessory view modifies printing-related properties that are used by the print preview, you should implement this method to return the key paths for those properties. For example, if you write an accessory view that lets the user change the left and right document margins in the current `NSPrintInfo` object, you would return the following key paths: `representedObject.leftMargin`, `representedObject.rightMargin`. (The `NSPrintInfo` object is the represented object of the accessory controller.)

Implementation of this method is optional. You do not need to implement this method if you are not using the `NSPrintPanel` object's built-in preview facilities. If you do use these facilities, however, you should implement this method.

**localizedSummaryItems**

Returns an array of dictionaries containing the localized user setting summary strings.

```
- (NSArray *)localizedSummaryItems
```

**Return Value**

An array of `NSDictionary` objects, each of which contains a `NSPrintPanelAccessorySummaryItemNameKey` and `NSPrintPanelAccessorySummaryItemDescriptionKey` key. The values for the keys are both strings. This method must not return `nil`.

**Discussion**

Accessory panels must implement this method to return information about the panel's current settings. The returned array should contain a dictionary for each setting that is managed by the accessory panel and each dictionary should contain two key-value pairs identifying the name of the setting and its current value.

Your accessory view must be KVO-compliant for the `localizedSummaryItems` key path because `NSPrintPanel` object observes that key path and uses it to keep the contents of the summary view up to date. This means your view should manually send KVO notifications to observers for the `localizedSummaryItems` key path whenever the contents of the set of summary items changes. For more information on supporting key-value observing and manual notifications, see *Key-Value Observing Programming Guide*.

## Constants

**Printing Summary Item Keys**

These keys must be included in the dictionaries returned by the `localizedSummaryItems` (page 3592) method.

```
NSString *NSPrintPanelAccessorySummaryItemNameKey;
NSString *NSPrintPanelAccessorySummaryItemDescriptionKey;
```

**Constants**

`NSPrintPanelAccessorySummaryItemNameKey`

Used as a key to specify the name of the accessory panel setting. The corresponding value should be an `NSString` object.

Available in Mac OS X v10.5 and later.

Declared in `NSPrintPanel.h`.

`NSPrintPanelAccessorySummaryItemDescriptionKey`

Used as a key to identify the current value of the accessory panel setting. The corresponding value should be an `NSString` object.

Available in Mac OS X v10.5 and later.

Declared in `NSPrintPanel.h`.

**Declared In**

`NSPrintPanel.h`

# NSServicesRequests Protocol Reference

(informal protocol)

---

|                        |                                             |
|------------------------|---------------------------------------------|
| <b>Framework</b>       | /System/Library/Frameworks/AppKit.framework |
| <b>Declared in</b>     | AppKit/NSApplication.h                      |
| <b>Companion guide</b> | System Services                             |

## Overview

This informal protocol consists of two methods, [writeSelectionToPasteboard:types:](#) (page 3596) and [readSelectionFromPasteboard:](#) (page 3595). The first method provides data to a remote service, and the second receives any data the remote service might send back. Both respond to messages that are generated when the user chooses a command from the Services menu.

## Tasks

### Working with Pasteboards

- [readSelectionFromPasteboard:](#) (page 3595)  
Reads data from the pasteboard and uses it to replace the current selection.
- [writeSelectionToPasteboard:types:](#) (page 3596)  
Writes the current selection to the pasteboard.

## Instance Methods

### readSelectionFromPasteboard:

Reads data from the pasteboard and uses it to replace the current selection.

- (BOOL)readSelectionFromPasteboard:(NSPasteboard \*)*pboard*

#### Parameters

*pboard*

The pasteboard containing the data to read.

#### Return Value

YES if your implementation was able to read the pasteboard data successfully; otherwise, NO.

**Discussion**

You implement this method to replace your application's current selection (that is, the text or objects that are currently selected) with the data on the pasteboard. The data would have been placed in the pasteboard by another application in response to a remote message from the Services menu. A

[readSelectionFromPasteboard:](#) message is sent to the same object that previously received a

[writeSelectionToPasteboard:types:](#) (page 3596) message.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSApplication.h`

**writeSelectionToPasteboard:types:**

Writes the current selection to the pasteboard.

```
- (BOOL)writeSelectionToPasteboard:(NSPasteboard *)pboard types:(NSArray *)types
```

**Parameters**

*pboard*

The pasteboard to receive your data.

*types*

An array of `NSString` objects listing the types of data that you should write to the pasteboard. You should write data to the pasteboard for as many of the types as you support.

**Return Value**

YES if your implementation was able to write one or more types to the pasteboard; otherwise, NO.

**Discussion**

A [writeSelectionToPasteboard:types:](#) message is sent to the first responder when the user chooses a command from the Services menu, but only if the receiver didn't return `nil` to a previous

[validRequestorForSendType:returnType:](#) (page 2164) message.

After your method writes the data to the pasteboard, a remote message is sent to the application that provides the service the user requested. If the service provider supplies return data to replace the selection, the first responder will then receive a [readSelectionFromPasteboard:](#) (page 3595) message.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [validRequestorForSendType:returnType:](#) (page 2164) (NSResponder)

# NSTableDataSource Protocol Reference

(informal protocol)

---

|                        |                                             |
|------------------------|---------------------------------------------|
| <b>Framework</b>       | /System/Library/Frameworks/AppKit.framework |
| <b>Declared in</b>     | AppKit/NSTableView.h                        |
| <b>Companion guide</b> | Table View Programming Guide                |

## Overview

The `NSTableDataSource` informal protocol declares the methods that an instance of `NSTableView` uses to access the contents of its data source object.

**Note:** Some of the methods in this protocol, such as `tableView:objectValueForTableColumn:row:` (page 3600) and `numberOfRowsInTableView:` (page 3598) along with other methods that return data, are called very frequently, so they must be efficient.

## Tasks

### Getting Values

- `numberOfRowsInTableView:` (page 3598)  
Returns the number of records managed for a *TableView* by the data source object.
- `tableView:objectValueForTableColumn:row:` (page 3600)  
Invoked by the table view to return the data object associated with the specified row and column.

### Setting Values

- `tableView:setObjectValue:forTableColumn:row:` (page 3600)  
Set the data object for an item in a given row in a given column.

### Dragging

- `tableView:acceptDrop:row:dropOperation:` (page 3599)  
Invoked by a *TableView* when the mouse button is released over a table view that previously decided to allow a drop.

- `tableView:namesOfPromisedFilesDroppedAtDestination:forDraggedRowsWithIndexes:` (page 3599)  
Returns an array of filenames that represent the *indexSet* rows for a drag to *dropDestination*.
- `tableView:validateDrop:proposedRow:proposedDropOperation:` (page 3601)  
Used by *aTableView* to determine a valid drop target.
- `tableView:writeRowsWithIndexes:toPasteboard:` (page 3603)  
Returns a Boolean value that indicates whether a drag operation is allowed.

## Sorting

- `tableView:sortDescriptorsDidChange:` (page 3601)  
Invoked by *aTableView* to indicate that sorting may need to be done.

## Deprecated Methods

- `tableView:writeRows:toPasteboard:` (page 3602) **Deprecated in Mac OS X v10.4 and later**  
This method has been deprecated. You should implement `tableView:writeRowsWithIndexes:toPasteboard:` (page 3603) instead.

## Instance Methods

### numberOfRowsInTableView:

Returns the number of records managed for *aTableView* by the data source object.

- (NSInteger)numberOfRowsInTableView:(NSTableView \*)*aTableView*

#### Parameters

*aTableView*

The table view that sent the message.

#### Return Value

The number of rows in *aTableView*.

#### Discussion

An instance of *NSTableView* uses this method to determine how many rows it should create and display.

**Note:** `numberOfRowsInTableView:` is called very frequently, so it must be efficient.

#### Availability

Available in Mac OS X v10.0 and later.

#### Declared In

*NSTableView.h*

**tableView:acceptDrop:row:dropOperation:**

Invoked by *aTableView* when the mouse button is released over a table view that previously decided to allow a drop.

```
- (BOOL)tableView:(NSTableView *)aTableView acceptDrop:(id < NSDraggingInfo >)info
 row:(NSInteger)row dropOperation:(NSTableViewDropOperation)operation
```

**Parameters**

*aTableView*

The table view that sent the message.

*info*

An object that contains more information about this dragging operation.

*row*

The index of the proposed target row.

*operation*

The type of dragging operation.

**Return Value**

YES if the drop operation was successful, otherwise NO.

**Discussion**

The data source should incorporate the data from the dragging pasteboard in the implementation of this method. You can get the data for the drop operation from *info* using the [draggingPasteboard](#) (page 3506) method.

To accept a drop on the second row, *row* would be 2 and *operation* would be `NSTableViewDropOn`. To accept a drop below the last row, *row* would be `[aTableView numberOfRows]` and *operation* would be `NSTableViewDropAbove`.

Implementation of this method is optional.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSTableView.h`

**tableView:namesOfPromisedFilesDroppedAtDestination:forDraggedRowsWithIndexes:**

Returns an array of filenames that represent the *indexSet* rows for a drag to *dropDestination*.

```
- (NSArray *)tableView:(NSTableView *)aTableView
 namesOfPromisedFilesDroppedAtDestination:(NSURL *)dropDestination
 forDraggedRowsWithIndexes:(NSIndexSet *)indexSet
```

**Parameters**

*aTableView*

The table view that sent the message.

*dropDestination*

The drop location where the files are created.

*indexSet*

The indexes of the items being dragged.

#### Return Value

An array of filenames (not full paths) for the created files that the receiver promises to create.

#### Discussion

This method is called when a destination has accepted a promise drag.

For more information on file promise dragging, see documentation on the `NSDraggingSource` protocol and `namesOfPromisedFilesDroppedAtDestination:` (page 3507).

#### Availability

Available in Mac OS X v10.4 and later.

#### Declared In

`NSTableView.h`

## **tableView:objectValueForTableColumn:row:**

Invoked by the table view to return the data object associated with the specified row and column.

```
- (id)tableView:(NSTableView *)aTableView objectValueForTableColumn:(NSTableColumn *)aTableColumn row:(NSInteger)rowIndex
```

#### Parameters

*aTableView*

The table view that sent the message.

*aTableColumn*

A column in in *aTableView*.

*rowIndex*

The row of the item in *aTableColumn*.

#### Return Value

An item in the data source in the specified `tableColumn` of the view.

#### Discussion

**Note:** `tableView:objectValueForTableColumn:row:` is called each time the table cell needs to be redisplayed, so it must be efficient.

#### Availability

Available in Mac OS X v10.0 and later.

#### Declared In

`NSTableView.h`

## **tableView:setObjectValue:forTableColumn:row:**

Set the data object for an item in a given row in a given column.

```
- (void)tableView:(NSTableView *)aTableView setObjectValue:(id)anObject
 forTableColumn:(NSTableColumn *)aTableColumn row:(NSInteger)rowIndex
```

**Parameters***aTableView*

The table view that sent the message.

*anObject*

The new value for the item.

*aTableColumn*A column in *aTableView*.*rowIndex*The row of the item in *aTableColumn*.**Discussion**

Implementation of this method is optional.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSTableView.h

**tableView:sortDescriptorsDidChange:**Invoked by *aTableView* to indicate that sorting may need to be done.

```
- (void)tableView:(NSTableView *)aTableView sortDescriptorsDidChange:(NSArray
 *)oldDescriptors
```

**Parameters***aTableView*

The table view that sent the message.

*oldDescriptors*

An array that contains the previous descriptors.

**Discussion**

The data source typically sorts and reloads the data, and adjusts the selections accordingly. If you need to know the current sort descriptors and the data source does not manage them itself, you can get the current sort descriptors by sending *aTableView* a [sortDescriptors](#) (page 2615) message.

Implementation of this method is optional.

**Availability**

Available in Mac OS X v10.3 and later.

**Declared In**

NSTableView.h

**tableView:validateDrop:proposedRow:proposedDropOperation:**Used by *aTableView* to determine a valid drop target.

```
- (NSDragOperation)tableView:(NSTableView *)aTableView validateDrop:(id <
 NSDraggingInfo >)info proposedRow:(NSInteger)row
 proposedDropOperation:(NSTableViewDropOperation)operation
```

**Parameters***aTableView*

The table view that sent the message.

*info*

An object that contains more information about this dragging operation.

*row*

The index of the proposed target row.

*operation*

The type of dragging operation proposed.

**Return Value**

The dragging operation the data source will perform.

**Discussion**

The data source may “retarget” a drop if desired by calling [setDropRow:dropOperation:](#) (page 2610) and returning something other than `NSDragOperationNone`. One may choose to retarget for various reasons (e.g. for better visual feedback when inserting into a sorted position).

To propose a drop on the second row, *row* would be 2 and *operation* would be `NSTableViewDropOn`. To propose a drop below the last row, *row* would be `[aTableView numberOfRows]` and *operation* would be `NSTableViewDropAbove`.

Implementation of this method is optional.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSTableView.h`

**tableView:writeRows:toPasteboard:**

This method has been deprecated. You should implement

[tableView:writeRowsWithIndexes:toPasteboard:](#) (page 3603) instead. (Deprecated in Mac OS X v10.4 and later.)

```
- (BOOL)tableView:(NSTableView *)aTableView writeRows:(NSArray *)rows
 toPasteboard:(NSPasteboard *)pboard
```

**Discussion**

Invoked by *aTableView* after it has been determined that a drag should begin, but before the drag has been started. To refuse the drag, return `NO`. To start a drag, return `YES` and place the drag data onto *pboard* (data, owner, and so on). The drag image and other drag-related information will be set up and provided by the table view once this call returns with `YES`. *rows* is the list of row numbers that will be participating in the drag.

Implementation of this method is optional.

**Availability**

Deprecated in Mac OS X v10.4 and later.

**Declared In**

NSTableView.h

**tableView:writeRowsWithIndexes:toPasteboard:**

Returns a Boolean value that indicates whether a drag operation is allowed.

```
- (BOOL)tableView:(NSTableView *)aTableView writeRowsWithIndexes:(NSIndexSet *)rowIndexes toPasteboard:(NSPasteboard *)pboard
```

**Parameters**

*aTableView*

The table view that sent the message.

*rowIndexes*

An index set of row numbers that will be participating in the drag.

*pboard*

The pasteboard to which to write the drag data.

**Return Value**

*YES* if the drag operation is allowed, *NO* otherwise.

**Discussion**

Invoked by *aTableView* after it has been determined that a drag should begin, but before the drag has been started.

To refuse the drag, return *NO*. To start a drag, return *YES* and place the drag data onto *pboard* (data, owner, and so on). The drag image and other drag-related information will be set up and provided by the table view once this call returns with *YES*.

Implementation of this method is optional.

**Availability**

Available in Mac OS X v10.4 and later.

**Declared In**

NSTableView.h

# NSTextAttachmentCell Protocol Reference

|-------------------------|----------------------------------------------------------------------|
| <b>Adopted by</b>       | NSTextAttachmentCell                                                 |
| <b>Conforms to</b>      | NSObject                                                             |
| <b>Framework</b>        | /System/Library/Frameworks/AppKit.framework                          |
| <b>Availability</b>     | Available in Mac OS X v10.0 and later.                               |
| <b>Declared in</b>      | AppKit/NSTextAttachment.h                                            |
| <b>Companion guides</b> | Text System Overview<br>Text Attachment Programming Topics for Cocoa |

## Overview

The NSTextAttachmentCell protocol declares the interface for objects that draw text attachment icons and handle mouse events on their icons. With the exceptions of [cellBaselineOffset](#) (page 3607), [setAttachment:](#) (page 3609), and [attachment](#) (page 3606), all of these methods are implemented by the NSCell class and described in that class specification.

See the NSAttributedString and NSTextView class specifications for general information on text attachments.

## Tasks

### Drawing

- [drawWithFrame:inView:](#) (page 3608)  
Draws the receiver's image within *cellFrame* in *aView*, which is the view currently focused.
- [drawWithFrame:inView:characterIndex:](#) (page 3608)  
Draws the receiver's image within *cellFrame* in *aView*, which is the view currently focused. *charIndex* is the index of the attachment character within the text.
- [drawWithFrame:inView:characterIndex:layoutManager:](#) (page 3608)  
Draws the receiver's image within *cellFrame* in *controlView*, which is the view currently focused. *charIndex* is the index of the attachment character within the text. *layoutManager* is the layout manager for the text.

- `highlight:withFrame:inView:` (page 3609)  
Draws the receiver's image—with highlighting if *flag* is YES—within *cellFrame* in *aView*, which should be the focus view.

## Cell Size and Position

- `cellSize` (page 3608)  
Returns the size of the attachment's icon.
- `cellBaselineOffset` (page 3607)  
Returns the position where the attachment cell's image should be drawn in text, relative to the current point established in the glyph layout.
- `cellFrameForTextContainer:proposedLineFragment:glyphPosition:characterIndex:` (page 3607)  
Returns the frame of the cell as it would be drawn as the character at the given glyph *position*, and character index, *charIndex*, in *textContainer*.

## Event Handling

- `wantsToTrackMouse` (page 3611)  
Returns YES if the receiver will handle a mouse event occurring over its image (to support dragging, for example), NO otherwise.
- `wantsToTrackMouseForEvent:inRect:ofView:atCharacterIndex:` (page 3611)  
Allows an attachment to specify what events it would want to track the mouse for.
- `trackMouse:inRect:ofView:untilMouseUp:` (page 3610)  
Handles a mouse-down event on the receiver's image.
- `trackMouse:inRect:ofView:atCharacterIndex:untilMouseUp:` (page 3609)  
Handles a mouse-down event on the receiver's image.

## Setting the Attachment

- `setAttachment:` (page 3609)  
Sets the text attachment object that owns the receiver to *anAttachment*, without retaining it (the text attachment, as the owner, retains the cell).
- `attachment` (page 3606)  
Returns the text attachment object that owns the receiver.

## Instance Methods

### attachment

Returns the text attachment object that owns the receiver.

- (NSTextAttachment \*)attachment

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [setAttachment:](#) (page 3609)

**Related Sample Code**

Quartz Composer WWDC 2005 TextEdit  
TextEditPlus

**Declared In**

NSTextAttachment.h

## cellBaselineOffset

Returns the position where the attachment cell’s image should be drawn in text, relative to the current point established in the glyph layout.

– (NSPoint)cellBaselineOffset

**Discussion**

The image should be drawn so its lower-left corner lies on this point.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [icon](#) (page 1112) (NSFileWrapper)

**Declared In**

NSTextAttachment.h

## cellFrameForTextContainer:proposedLineFragment:glyphPosition:characterIndex:

Returns the frame of the cell as it would be drawn as the character at the given glyph *position*, and character index, *charIndex*, in *textContainer*.

– (CGRect)cellFrameForTextContainer:(NSTextContainer \*)*textContainer*  
proposedLineFragment:(CGRect)*lineFrag* glyphPosition:(NSPoint)*position*  
characterIndex:(NSUInteger)*charIndex*

**Discussion**

The proposed line fragment is specified by *lineFrag*.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSTextAttachment.h

## cellSize

Returns the size of the attachment's icon.

- (NSSize)cellSize

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [icon](#) (page 1112) (NSFileWrapper)
- [fileWrapper](#) (page 2711) (NSTextAttachment)

### Declared In

NSTextAttachment.h

## drawWithFrame:inView:

Draws the receiver's image within *cellFrame* in *aView*, which is the view currently focused.

- (void)drawWithFrame:(NSRect)cellFrame inView:(NSView \*)aView

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [drawWithFrame:inView:](#) (page 556) (NSCell)
- [lockFocus](#) (page 3135) (NSView)

### Declared In

NSTextAttachment.h

## drawWithFrame:inView:characterIndex:

Draws the receiver's image within *cellFrame* in *aView*, which is the view currently focused. *charIndex* is the index of the attachment character within the text.

- (void)drawWithFrame:(NSRect)cellFrame inView:(NSView \*)aView  
characterIndex:(NSUInteger)charIndex

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

NSTextAttachment.h

## drawWithFrame:inView:characterIndex:layoutManager:

Draws the receiver's image within *cellFrame* in *controlView*, which is the view currently focused. *charIndex* is the index of the attachment character within the text. *layoutManager* is the layout manager for the text.

```
- (void)drawWithFrame:(NSRect)cellFrame inView:(NSView *)controlView
 characterIndex:(NSUInteger)charIndex layoutManager:(NSLayoutManager
 *)layoutManager
```

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSTextAttachment.h

**highlight:withFrame:inView:**

Draws the receiver's image—with highlighting if *flag* is YES—within *cellFrame* in *aView*, which should be the focus view.

```
- (void)highlight:(BOOL)flag withFrame:(NSRect)cellFrame inView:(NSView *)aView
```

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [highlight:withFrame:inView:](#) (page 561) (NSCell)
- [lockFocus](#) (page 3135) (NSView)

**Declared In**

NSTextAttachment.h

**setAttachment:**

Sets the text attachment object that owns the receiver to *anAttachment*, without retaining it (the text attachment, as the owner, retains the cell).

```
- (void)setAttachment:(NSTextAttachment *)anAttachment
```

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [attachment](#) (page 3606)
- [setAttachmentCell:](#) (page 2712) (NSTextAttachment)

**Declared In**

NSTextAttachment.h

**trackMouse:inRect:ofView:atCharacterIndex:untilMouseUp:**

Handles a mouse-down event on the receiver's image.

```
- (BOOL)trackMouse:(NSEvent *)theEvent inRect:(NSRect)cellFrame ofView:(NSView
 *)aTextView atCharacterIndex:(NSUInteger)charIndex untilMouseUp:(BOOL)flag
```

**Discussion**

*theEvent* is the mouse-down event. *cellFrame* is the region of *aTextView* in which you should track further mouse events. *charIndex* is the position in the text at which this attachment appears. *aTextView* is the view that received the event. It's assumed to be an `NSTextView`, and should be the focus view. If *flag* is YES, the receiver tracks the mouse until a mouse-up event occurs; if *flag* is NO, it stops tracking when a mouse-dragged event occurs outside of *cellFrame*. Returns YES if the receiver successfully finished tracking the mouse (typically through a mouse-up event), NO otherwise (such as when the mouse is dragged outside *cellFrame*).

`NSTextAttachmentCell`'s implementation of this method calls upon *aTextView*'s delegate to handle the event. If *theEvent* is a mouse-up event for a double click, the text attachment cell sends the delegate a `textView:doubleClickedOnCell:inRect:` (page 2907) message and returns YES. Otherwise, depending on whether the user clicks or drags the cell, it sends the delegate a `textView:clickedOnCell:inRect:` (page 2904) or a `textView:draggedCell:inRect:event:` (page 2908) message and returns YES. `NSTextAttachmentCell`'s implementation returns NO only if *flag* is NO and the mouse is dragged outside of *cellFrame*. The delegate methods are invoked only if the delegate responds.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSTextAttachment.h`

**trackMouse:inRect:ofView:untilMouseUp:**

Handles a mouse-down event on the receiver's image.

```
- (BOOL)trackMouse:(NSEvent *)theEvent inRect:(NSRect)cellFrame ofView:(NSView *)aTextView untilMouseUp:(BOOL)flag
```

**Discussion**

*theEvent* is the mouse-down event. *cellFrame* is the region of *aTextView* in which further mouse events should be tracked. *aTextView* is the view that received the event. It's assumed to be an `NSTextView` and should be the focus view. If *flag* is YES, the receiver tracks the mouse until a mouse-up event occurs; if *flag* is NO, it stops tracking when a mouse-dragged event occurs outside of *cellFrame*. Returns YES if the receiver successfully finished tracking the mouse (typically through a mouse-up event), NO otherwise (such as when the cursor is dragged outside *cellFrame*).

`NSTextAttachmentCell`'s implementation of this method calls upon the delegate of *aTextView* to handle the event. If *theEvent* is a mouse-up event for a double click, the text attachment cell sends the delegate a `textView:doubleClickedOnCell:inRect:` (page 2907) message and returns YES. Otherwise, depending on whether the user clicks or drags the cell, it sends the delegate a `textView:clickedOnCell:inRect:` (page 2904) or a `textView:draggedCell:inRect:event:` (page 2908) message and returns YES. `NSTextAttachmentCell`'s implementation returns NO only if *flag* is NO and the cursor is dragged outside of *cellFrame*. The delegate methods are invoked only if the delegate responds.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [wantsToTrackMouse](#) (page 3611)
- [trackMouse:inRect:ofView:untilMouseUp:](#) (page 609) (`NSCell`)
- [lockFocus](#) (page 3135) (`NSView`)

**Declared In**

NSTextAttachment.h

**wantsToTrackMouse**

Returns YES if the receiver will handle a mouse event occurring over its image (to support dragging, for example), NO otherwise.

- (BOOL)wantsToTrackMouse

**Discussion**

NSTextAttachmentCell's implementation of this method returns YES. The NSView containing the cell should invoke this method before sending a [trackMouse:inRect:ofView:untilMouseUp:](#) (page 3610) message.

For an attachment in an attributed string, if the attachment cell returns NO its attachment character should be selected rather than the cell being asked to track the mouse. This results in the attachment icon behaving as any regular glyph in text.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSTextAttachment.h

**wantsToTrackMouseForEvent:inRect:ofView:atCharacterIndex:**

Allows an attachment to specify what events it would want to track the mouse for.

- (BOOL)wantsToTrackMouseForEvent:(NSEvent \*)*theEvent* inRect:(NSRect)*cellFrame*  
ofView:(NSView \*)*controlView* atCharacterIndex:(NSUInteger)*charIndex*

**Discussion**

*theEvent* is the event in question that occurred in *cellFrame* inside *controlView*. *charIndex* is the index of the attachment character within the text. If [wantsToTrackMouse](#) (page 3611) returns YES, this method allows the attachment to decide whether it wishes to do so for particular events.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSTextAttachment.h

|                         |                                               |
|-------------------------|-----------------------------------------------|
| <b>Adopted by</b>       | NSInputManager                                |
| <b>Framework</b>        | /System/Library/Frameworks/AppKit.framework   |
| <b>Availability</b>     | Available in Mac OS X v10.0 and later.        |
| <b>Declared in</b>      | AppKit/NSInputManager.h                       |
| <b>Companion guides</b> | Text System Overview<br>Text Input Management |

## Overview

The `NSTextInput` protocol defines the methods that Cocoa text views must implement in order to interact properly with the text input management system. `NSTextView` and its abstract superclass `NSText` are the only classes included in Cocoa that implement `NSTextInput`. To create another text view class, you can either subclass `NSTextView` (and not `NSText`, for historical reasons), or subclass `NSView` and implement the `NSTextInput` protocol.

**Important:** Methods specific to the `NSTextInput` protocol are intended for dealing with text input and generally are not suitable for other purposes.

## Tasks

### Marked Text

- [hasMarkedText](#) (page 3616)  
Returns a Boolean value indicating whether or not the receiver has marked text.
- [markedRange](#) (page 3617)  
Returns the range of the marked text.
- [selectedRange](#) (page 3618)  
Returns the range of selected text.
- [setMarkedText:selectedRange:](#) (page 3618)  
Replaces currently marked text in the receiver's text storage with the given string and sets the selection to the given range, computed from the beginning of the marked text.

- `unmarkText` (page 3619)  
Removes any marking from pending input text and disposes of the marked text as it wishes. The text view should accept the marked text as if it had been inserted normally.
- `validAttributesForMarkedText` (page 3619)  
Returns an array of names for the attributes supported by the receiver.

## Text Storage

- `attributedStringFromRange:` (page 3614)  
Returns an attributed string derived from the given range in the receiver's text storage.
- `insertText:` (page 3617)  
Inserts the given string into the receiver's text storage.

## Character Coordinates

- `characterIndexForPoint:` (page 3615)  
Returns the index of the character whose frame rectangle includes the given point.
- `firstRectForCharacterRange:` (page 3616)  
Returns the first frame rectangle for characters in the given range, in screen coordinates.

## Key Bindings

- `doCommandBySelector:` (page 3616)  
Invokes the given selector if possible.

## Other

- `conversationIdentifier` (page 3615)  
Returns a number used to identify the receiver's context to the input server.

## Instance Methods

### **attributedStringFromRange:**

Returns an attributed string derived from the given range in the receiver's text storage.

- `(NSAttributedString *)attributedStringFromRange:(NSRange)theRange`

#### **Parameters**

*theRange*

The range in the text storage from which to create the returned string.

#### **Return Value**

The string created from the given range.

**Discussion**

This method allows input managers to query any range in text storage.

An implementation of this method should be prepared for *theRange* to be out-of-bounds. For example, the InkWell text input service can ask for the contents of the text input client that extends beyond the document's range. In this case, you should return the intersection of the document's range and *theRange*. If the location of *theRange* is completely outside of the document's range, return *nil*.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSInputManager.h`

**characterIndexForPoint:**

Returns the index of the character whose frame rectangle includes the given point.

```
- (NSUInteger)characterIndexForPoint:(NSPoint)thePoint
```

**Parameters**

*thePoint*

A point, in screen coordinates.

**Return Value**

The character index, measured from the start of the receiver's text storage, of the character containing the given point. Returns `NSNotFound` if the cursor is not within a character.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSInputManager.h`

**conversationIdentifier**

Returns a number used to identify the receiver's context to the input server.

```
- (NSInteger)conversationIdentifier
```

**Return Value**

The identifying number of the receiver.

**Discussion**

Each text view within an application should return a unique identifier (typically its address). However, multiple text views sharing the same text storage must all return the same identifier.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSInputManager.h`

## doCommandBySelector:

Invokes the given selector if possible.

- (void)doCommandBySelector:(SEL)aSelector

### Parameters

*aSelector*

The selector to be invoked.

### Discussion

If *aSelector* cannot be invoked, then `doCommandBySelector:` should not pass this message up the responder chain. `NSResponder` also implements this method, and it does forward uninvokable commands up the responder chain, but a text view should not. A text view implementing the `NSTextInput` protocol inherits from `NSView`, which inherits from `NSResponder`, so your implementation of this method will override the one in `NSResponder`. It should not call `super`.

### Availability

Available in Mac OS X v10.0 and later.

### See Also

- [interpretKeyEvents:](#) (page 2131) (`NSResponder`)
- [doCommandBySelector:](#) (page 2125) (`NSResponder`)

### Declared In

`NSInputManager.h`

## firstRectForCharacterRange:

Returns the first frame rectangle for characters in the given range, in screen coordinates.

- (NSRect)firstRectForCharacterRange:(NSRange)theRange

### Parameters

*theRange*

The character range whose frame is returned.

### Return Value

The frame rectangle for the given range of characters.

### Discussion

If *theRange* spans multiple lines of text in the text view, the rectangle returned is the one for the characters in the first line. If the length of *theRange* is 0 (as it would be if there is nothing selected at the insertion point), the rectangle coincides with the insertion point, and its width is 0.

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

`NSInputManager.h`

## hasMarkedText

Returns a Boolean value indicating whether or not the receiver has marked text.

- (BOOL)hasMarkedText

**Return Value**

YES if the receiver has marked text, NO if it doesn't.

**Discussion**

Unlike other methods in this protocol, this one is not called by an input server. The text view itself may call this method to determine whether there currently is marked text. `NSTextView`, for example, disables the Edit > Copy menu item when this method returns YES.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [markedRange](#) (page 3617)

**Declared In**

`NSInputManager.h`

## insertText:

Inserts the given string into the receiver's text storage.

- (void)insertText:(id)aString

**Parameters**

*aString*

Either an `NSString` or an `NSAttributedString` object.

**Discussion**

This method is the entry point for inserting text typed by the user and is generally not suitable for other purposes. Programmatic modification of the text is best done by operating on the text storage directly. Because this method pertains to the actions of the user, the text view must be editable for the insertion to work.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSInputManager.h`

## markedRange

Returns the range of the marked text.

- (NSRange)markedRange

**Return Value**

The range of marked text.

**Discussion**

The returned range measures from the start of the receiver's text storage. The return value's `location` is `NSNotFound`, and its `length` is 0 if and only if [hasMarkedText](#) (page 3616) returns NO.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setMarkedText:selectedRange:](#) (page 3618)
- [unmarkText](#) (page 3619)
- [hasMarkedText](#) (page 3616)

**Declared In**

`NSInputManager.h`

**selectedRange**

Returns the range of selected text.

- `(NSRange)selectedRange`

**Return Value**

The range of selected text.

**Discussion**

The returned range measures from the start of the receiver's text storage. If there is no selection, the return value's `location` is `NSNotFound`, and its `length` is 0.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [setMarkedText:selectedRange:](#) (page 3618)

**Declared In**

`NSInputManager.h`

**setMarkedText:selectedRange:**

Replaces currently marked text in the receiver's text storage with the given string and sets the selection to the given range, computed from the beginning of the marked text.

- `(void)setMarkedText:(id)aString selectedRange:(NSRange)selRange`

**Parameters**

*aString*

Either an `NSString` or an `NSAttributedString` object; must not be `nil`.

*selRange*

The range within *aString* to set as the selection.

**Discussion**

If there is no marked text, the current selection is replaced. If there is no selection, the string is inserted at the insertion point.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [selectedRange](#) (page 3618)
- [unmarkText](#) (page 3619)

**Declared In**

NSInputManager.h

## unmarkText

Removes any marking from pending input text and disposes of the marked text as it wishes. The text view should accept the marked text as if it had been inserted normally.

- (void)unmarkText

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

- [selectedRange](#) (page 3618)
- [setMarkedText:selectedRange:](#) (page 3618)

**Declared In**

NSInputManager.h

## validAttributesForMarkedText

Returns an array of names for the attributes supported by the receiver.

- (NSArray \*)validAttributesForMarkedText

**Return Value**

An array of `NSString` objects representing names for the supported attributes.

**Discussion**

The input server may choose to use some of these attributes in the text it inserts or in marked text. Returns an empty array if no attributes are supported. See [NSAttributedString Additions](#) (page 255) for the set of string constants that you could return in the array.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSInputManager.h

## Overview

The `NSTextInputClient` protocol defines the methods that Cocoa text views must implement in order to interact properly with the text input management system. To create another text view class, you can either subclass `NSTextView` (and not `NSText`, for historical reasons), or subclass `NSView` and implement the `NSTextInputClient` protocol.

**Important:** Methods specific to the `NSTextInputClient` protocol are intended for dealing with text input and generally are not suitable for other purposes.

## Tasks

### Handling Marked Text

- [hasMarkedText](#) (page 3626)  
Returns a Boolean value indicating whether the receiver has marked text.
- [markedRange](#) (page 3627)  
Returns the range of the marked text.
- [selectedRange](#) (page 3627)  
Returns the range of selected text.
- [setMarkedText:selectedRange:replacementRange:](#) (page 3628)  
Replaces a specified range in the receiver's text storage with the given string and sets the selection.
- [unmarkText](#) (page 3628)  
Unmarks the marked text.
- [validAttributesForMarkedText](#) (page 3629)  
Returns an array of attribute names recognized by the receiver.

## Storing Text

- [attributedStringForProposedRange:actualRange:](#) (page 3623)  
Returns an attributed string derived from the given range in the receiver's text storage.
- [insertText:replacementRange:](#) (page 3626)  
Inserts the given string into the receiver, replacing the specified content.

## Getting Character Coordinates

- [characterIndexForPoint:](#) (page 3624)  
Returns the index of the character whose bounding rectangle includes the given point.
- [firstRectForCharacterRange:actualRange:](#) (page 3625)  
Returns the first logical boundary rectangle for characters in the given range.

## Binding Keystrokes

- [doCommandBySelector:](#) (page 3624)  
Invokes the action specified by the given selector.

## Optional Methods

- [attributedString](#) (page 3622)  
Returns an attributed string representing the receiver's text storage. (optional)
- [fractionOfDistanceThroughGlyphForPoint:](#) (page 3625)  
Returns the fraction of the distance from the left side of the character to the right side that a given point lies. (optional)
- [baselineDeltaForCharacterAtIndex:](#) (page 3623)  
Returns the baseline position of a given character relative to the origin of rectangle returned by [firstRectForCharacterRange:actualRange:](#) (page 3625). (optional)
- [windowLevel](#) (page 3629)  
Returns the window level of the receiver. (optional)

## Instance Methods

### attributedString

Returns an attributed string representing the receiver's text storage. (optional)

- (NSAttributedString \*)attributedString

#### Return Value

The attributed string of the receiver's text storage.

**Discussion**

Implementation of this method is optional. A class adopting the `NSTextInputClient` protocol can implement this interface if it can be done efficiently to enable callers of this interface to access arbitrary portions of the receiver's content more efficiently.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

`NSTextInputClient.h`

**attributedStringForProposedRange:actualRange:**

Returns an attributed string derived from the given range in the receiver's text storage.

```
- (NSAttributedString *)attributedStringForProposedRange:(NSRange)aRange
 actualRange:(NSRangePointer)actualRange
```

**Parameters**

*aRange*

The range in the text storage from which to create the returned string.

*actualRange*

The actual range of the returned string if it was adjusted, for example, to a grapheme cluster boundary or for performance or other reasons. `NULL` if range was not adjusted.

**Return Value**

The string created from the given range. May return `nil`.

**Discussion**

An implementation of this method should be prepared for *aRange* to be out of bounds. For example, the InkWell text input service can ask for the contents of the text input client that extends beyond the document's range. In this case, you should return the intersection of the document's range and *aRange*. If the location of *aRange* is completely outside of the document's range, return `nil`.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

`NSTextInputClient.h`

**baselineDeltaForCharacterAtIndex:**

Returns the baseline position of a given character relative to the origin of rectangle returned by [firstRectForCharacterRange:actualRange:](#) (page 3625). (optional)

```
- (CGFloat)baselineDeltaForCharacterAtIndex:(NSUInteger)anIndex
```

**Parameters**

*anIndex*

Index of the character whose baseline is tested.

**Return Value**

The vertical distance, in points, between the baseline of the character at *anIndex* and the rectangle origin.

**Discussion**

Implementation of this method is optional. This information allows the caller to determine finer-grained character positioning within the text storage of the text view adopting `NSTextInputClient`.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

`NSTextInputClient.h`

**characterIndexForPoint:**

Returns the index of the character whose bounding rectangle includes the given point.

- (NSUInteger)characterIndexForPoint:(NSPoint)*aPoint*

**Parameters**

*aPoint*

The point to test, in screen coordinates.

**Return Value**

The character index, measured from the start of the receiver's text storage, of the character containing the given point. Returns `NSNotFound` if the cursor is not within a character's bounding rectangle.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

`NSTextInputClient.h`

**doCommandBySelector:**

Invokes the action specified by the given selector.

- (void)doCommandBySelector:(SEL)*aSelector*

**Parameters**

*aSelector*

The selector to invoke.

**Discussion**

If *aSelector* cannot be invoked, then `doCommandBySelector:` should not pass this message up the responder chain. `NSResponder` also implements this method, and it does forward uninvokable commands up the responder chain, but a text view should not. A text view implementing the `NSTextInputClient` protocol inherits from `NSView`, which inherits from `NSResponder`, so your implementation of this method will override the one in `NSResponder`. It should not call `super`.

**Availability**

Available in Mac OS X v10.5 and later.

**See Also**

- [interpretKeyEvents:](#) (page 2131) (`NSResponder`)
- [doCommandBySelector:](#) (page 2125) (`NSResponder`)

**Declared In**

NSTextInputClient.h

**firstRectForCharacterRange:actualRange:**

Returns the first logical boundary rectangle for characters in the given range.

```
- (NSRect)firstRectForCharacterRange:(NSRange)aRange
 actualRange:(NSRangePointer)actualRange
```

**Parameters***aRange*

The character range whose boundary rectangle is returned.

*actualRange*

If non-NULL, contains the character range corresponding to the returned area if it was adjusted, for example, to a grapheme cluster boundary or characters in the first line fragment.

**Return Value**The boundary rectangle for the given range of characters, in screen coordinates. The rectangle's `size` value can be negative if the text flows to the left.**Discussion**

If *aRange* spans multiple lines of text in the text view, the rectangle returned is the one surrounding the characters in the first line. In that case *actualRange* contains the range covered by the first rect, so you can query all line fragments by invoking this method repeatedly. If the length of *aRange* is 0 (as it would be if there is nothing selected at the insertion point), the rectangle coincides with the insertion point, and its width is 0.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSTextInputClient.h

**fractionOfDistanceThroughGlyphForPoint:**

Returns the fraction of the distance from the left side of the character to the right side that a given point lies. (optional)

```
- (CGFloat)fractionOfDistanceThroughGlyphForPoint:(NSPoint)aPoint
```

**Parameters***aPoint*

The point to test.

**Return Value**

The fraction of the distance *aPoint* is through the glyph in which it lies. May be 0 or 1 if *aPoint* is not within the bounding rectangle of a glyph (0 if the point is to the left or above the glyph; 1 if it's to the right or below).

**Discussion**

Implementation of this method is optional. This allows caller to perform precise selection handling.

For purposes such as dragging out a selection or placing the insertion point, a partial percentage less than or equal to 0.5 indicates that *aPoint* should be considered as falling before the glyph; a partial percentage greater than 0.5 indicates that it should be considered as falling after the glyph. If the nearest glyph doesn't lie under *aPoint* at all (for example, if *aPoint* is beyond the beginning or end of a line), this ratio is 0 or 1.

For example, if the glyph stream contains the glyphs “A” and “b”, with the width of “A” being 13 points, and *aPoint* is 8 points from the left side of “A”, then the fraction of the distance is 8/13, or 0.615. In this case, the *aPoint* should be considered as falling between “A” and “b” for purposes such as dragging out a selection or placing the insertion point.

#### Availability

Available in Mac OS X v10.5 and later.

#### Declared In

NSTextInputClient.h

## hasMarkedText

Returns a Boolean value indicating whether the receiver has marked text.

- (BOOL)hasMarkedText

#### Return Value

YES if the receiver has marked text; otherwise NO.

#### Discussion

The text view itself may call this method to determine whether there currently is marked text. `NSTextView`, for example, disables the Edit > Copy menu item when this method returns YES.

#### Availability

Available in Mac OS X v10.5 and later.

#### See Also

- [markedRange](#) (page 3627)

#### Declared In

NSTextInputClient.h

## insertText:replacementRange:

Inserts the given string into the receiver, replacing the specified content.

- (void)insertText:(id)aString  
replacementRange:(NSRange)replacementRange

#### Parameters

*aString*

The text to insert, either an `NSString` or `NSAttributedString` instance.

*replacementRange*

The range of content to replace in the receiver's text storage.

**Discussion**

This method is the entry point for inserting text typed by the user and is generally not suitable for other purposes. Programmatic modification of the text is best done by operating on the text storage directly. Because this method pertains to the actions of the user, the text view must be editable for the insertion to work.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

`NSTextInputClient.h`

## markedRange

Returns the range of the marked text.

- (NSRange)markedRange

**Return Value**

The range of marked text or `{NSNotFound, 0}` if there is no marked range.

**Discussion**

The returned range measures from the start of the receiver's text storage. The return value's `location` is `NSNotFound` and its `length` is 0 if and only if [hasMarkedText](#) (page 3626) returns NO.

**Availability**

Available in Mac OS X v10.5 and later.

**See Also**

- [hasMarkedText](#) (page 3626)
- [setMarkedText:selectedRange:replacementRange:](#) (page 3628)
- [unmarkText](#) (page 3628)

**Declared In**

`NSTextInputClient.h`

## selectedRange

Returns the range of selected text.

- (NSRange)selectedRange

**Return Value**

The range of selected text or `{NSNotFound, 0}` if there is no selection.

**Discussion**

The returned range measures from the start of the receiver's text storage, that is, from 0 to the document length.

**Availability**

Available in Mac OS X v10.5 and later.

**See Also**

- [setMarkedText:selectedRange:replacementRange:](#) (page 3628)

**Declared In**

NSTextInputClient.h

**setMarkedText:selectedRange:replacementRange:**

Replaces a specified range in the receiver's text storage with the given string and sets the selection.

```
- (void)setMarkedText:(id)aString
 selectedRange:(NSRange)selectedRange
 replacementRange:(NSRange)replacementRange
```

**Parameters**

*aString*

The string to insert. Can be either an `NSString` or `NSAttributedString` instance.

*selectedRange*

The range to set as the selection, computed from the beginning of the inserted string.

*replacementRange*

The range to replace, computed from the beginning of the marked text.

**Discussion**

If there is no marked text, the current selection is replaced. If there is no selection, the string is inserted at the insertion point.

When *aString* is an `NSString` object, the receiver is expected to render the marked text with distinguishing appearance (for example, `NSTextView` renders with [markedTextAttributes](#) (page 2846)).

**Availability**

Available in Mac OS X v10.5 and later.

**See Also**

- [selectedRange](#) (page 3627)

- [unmarkText](#) (page 3628)

**Declared In**

NSTextInputClient.h

**unmarkText**

Unmarks the marked text.

```
- (void)unmarkText
```

**Discussion**

The receiver removes any marking from pending input text and disposes of the marked text as it wishes. The text view should accept the marked text as if it had been inserted normally. If there is no marked text, the invocation of this method has no effect.

**Availability**

Available in Mac OS X v10.5 and later.

**See Also**

- [selectedRange](#) (page 3627)
- [setMarkedText:selectedRange:replacementRange:](#) (page 3628)

**Declared In**

NSTextInputClient.h

## validAttributesForMarkedText

Returns an array of attribute names recognized by the receiver.

- (NSArray\*)validAttributesForMarkedText

**Return Value**

An array of NSString objects representing names for the supported attributes.

**Discussion**

Returns an empty array if no attributes are supported. See *NSAttributedString Application Kit Additions Reference* for the set of string constants representing standard attributes.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSTextInputClient.h

## windowLevel

Returns the window level of the receiver. (optional)

- (NSInteger>windowLevel

**Return Value**

The window level of the receiver.

**Discussion**

Implementation of this method is optional. A class adopting NSTextInputClient can implement this interface to specify its window level if it is higher than NSFloatingWindowLevel.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSTextInputClient.h

# NSToolbarItemValidation Protocol Reference

(informal protocol)

---

|                        |                                             |
|------------------------|---------------------------------------------|
| <b>Framework</b>       | /System/Library/Frameworks/AppKit.framework |
| <b>Declared in</b>     | AppKit/NSToolbarItem.h                      |
| <b>Companion guide</b> | Toolbar Programming Topics for Cocoa        |

## Overview

A toolbar item with a valid target and action is enabled by default. To allow a toolbar item to be disabled in certain situations, a toolbar item's target can implement the `validateToolbarItem:` (page 3631) method.

**Note:** NSToolbarItem's `validate` (page 2984) method calls this method only if the item's target has a valid action defined on its target and if the item is not a custom view item. If you want to validate a custom view item, then you have to subclass NSToolbarItem and override `validate` (page 2984).

## Tasks

### Validating Toolbar Items

- `validateToolbarItem:` (page 3631)

If this method is implemented and returns NO, NSToolbar will disable *theItem*; returning YES causes *theItem* to be enabled.

## Instance Methods

### validateToolbarItem:

If this method is implemented and returns NO, NSToolbar will disable *theItem*; returning YES causes *theItem* to be enabled.

- (BOOL)validateToolbarItem:(NSToolbarItem \*)*theItem*

#### Discussion

NSToolbar only calls this method for image items.

**Note:** `validateToolbarItem:` is called very frequently, so it must be efficient.

If the receiver is the `target` for the actions of multiple toolbar items, it's necessary to determine which toolbar item *theItem* refers to by testing the `itemIdentifier`.

```
-(BOOL)validateToolbarItem:(NSToolbarItem *)toolbarItem
{
 BOOL enable = NO;
 if ([[toolbarItem itemIdentifier] isEqual:SaveDocToolbarItemIdentifier]) {
 // We will return YES (enable the save item)
 // only when the document is dirty and needs saving
 enable = [self isDocumentEdited];
 } else if ([[toolbarItem itemIdentifier]
isEqual:NSToolbarPrintItemIdentifier]) {
 // always enable print for this window
 enable = YES;
 }
 return enable;
}
```

#### Availability

Available in Mac OS X v10.0 and later.

#### See Also

- [validateVisibleItems](#) (page 2959) (NSToolbar)
- [validate](#) (page 2984) (NSToolbarItem)
- [target](#) (page 2983) (NSToolbarItem)

NSToolbarItem.h

# NSToolTipOwner Protocol Reference

(informal protocol)

---

|                        |                                             |
|------------------------|---------------------------------------------|
| <b>Framework</b>       | /System/Library/Frameworks/AppKit.framework |
| <b>Declared in</b>     | AppKit/NSView.h                             |
| <b>Companion guide</b> | Online Help                                 |

## Overview

The NSToolTipOwner informal protocol declares a method that allows an object to dynamically provide the text to a tool tip. If the tool tip object does not implement this method, the NSObject protocol *description* method is invoked instead.

## Tasks

### Obtaining Tool Tip Strings

- [view:stringForToolTip:point:userData:](#) (page 3633)

Returns the tool tip string to be displayed due to the cursor pausing at location *point* within the tool tip rectangle identified by *tag* in the view *view*.

## Instance Methods

### **view:stringForToolTip:point:userData:**

Returns the tool tip string to be displayed due to the cursor pausing at location *point* within the tool tip rectangle identified by *tag* in the view *view*.

```
- (NSString *)view:(NSView *)view stringForToolTip:(NSToolTipTag)tag
point:(NSPoint)point userData:(void *)userData
```

#### **Discussion**

*userData* is additional information provided by the creator of the tool tip rectangle.

#### **Availability**

Available in Mac OS X v10.0 and later.

**See Also**

– [addToolTipRect:owner:userData:](#) (page 3094) (NSView)

**Declared In**

NSView.h

# NSUserInterfaceValidations Protocol Reference

---

|                        |                                             |
|------------------------|---------------------------------------------|
| <b>Framework</b>       | /System/Library/Frameworks/AppKit.framework |
| <b>Availability</b>    | Available in Mac OS X v10.0 and later.      |
| <b>Declared in</b>     | AppKit/NSUserInterfaceValidation.h          |
| <b>Companion guide</b> | User Interface Validation                   |

## Overview

The `NSUserInterfaceValidations` protocol works with the `NSValidatedUserInterfaceItem` protocol to enable or disable a control automatically, depending on whether any responder in the responder chain can handle the control's action method. The `NSMenuItem` and `NSToolbarItem` classes take advantage of these protocols.

By conforming to this protocol, your custom responder can participate in this validation mechanism. To validate a control, the application calls `validateUserInterfaceItem:` for each item in the responder chain, starting with the first responder. If no responder returns `YES`, the item is disabled. For example, a menu item that sends the `copy:` action message would disable itself if no responder in the responder chain can be copied.

## Tasks

### Validating User Interface Items

- [validateUserInterfaceItem:](#) (page 3635)

Returns whether the receiver can handle the action method for a user interface item.

## Instance Methods

### **validateUserInterfaceItem:**

Returns whether the receiver can handle the action method for a user interface item.

- (BOOL)validateUserInterfaceItem:(id < NSValidatedUserInterfaceItem >)anItem

**Parameters***anItem*

The user interface item to validate. You can send *anItem* the [action](#) (page 3637) and [tag](#) (page 3638) messages.

**Return Value**

YES if the receiver can handle the action method; NO if it cannot.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSUserInterfaceValidation.h

# NSValidatedUserInterfaceItem Protocol Reference

---

|                        |                                             |
|------------------------|---------------------------------------------|
| <b>Framework</b>       | /System/Library/Frameworks/AppKit.framework |
| <b>Availability</b>    | Available in Mac OS X v10.0 and later.      |
| <b>Declared in</b>     | AppKit/NSUserInterfaceValidation.h          |
| <b>Companion guide</b> | User Interface Validation                   |

## Overview

The `NSValidatedUserInterfaceItem` protocol works with the `NSUserInterfaceValidations` protocol to enable or disable a control automatically, depending on whether any responder in the responder chain can handle the control's action method. The `NSMenuItem` and `NSToolbarItem` classes implement this protocol.

By conforming to this protocol, your control can participate in this validation mechanism. To validate a control, the application calls `validateUserInterfaceItem:` for each item in the responder chain, starting with the first responder. If no responder returns `YES`, the item is disabled. For example, a menu item that sends the `copy:` action message would disable itself if no responder in the responder chain can be copied.

## Tasks

### Getting Information About a User Interface Item

- [action](#) (page 3637)  
Returns the selector of the receiver's action method.
- [tag](#) (page 3638)  
Returns the receiver's tag integer.

## Instance Methods

### **action**

Returns the selector of the receiver's action method.

- (SEL)action

**Return Value**

The selector of the receiver's action method.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSUserInterfaceValidation.h

**tag**

Returns the receiver's tag integer.

- (NSInteger)tag

**Return Value**

The receiver's tag.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSUserInterfaceValidation.h

# NSWindowScripting Protocol Reference

(informal protocol)

---

|                        |                                             |
|------------------------|---------------------------------------------|
| <b>Framework</b>       | /System/Library/Frameworks/AppKit.framework |
| <b>Declared in</b>     | AppKit/NSWindowScripting.h                  |
| <b>Companion guide</b> | Cocoa Scripting Guide                       |

## Overview

Category on `NSWindow`. Supports window scripting for all scriptable Cocoa applications by getting and setting standard properties and handling the `close`, `print`, and `save` AppleScript commands.

## Tasks

### Getting Scripting Attribute Information About a Window

- [hasCloseBox](#) (page 3641)  
Returns YES if the receiver has a close box.
- [hasTitleBar](#) (page 3642)  
Returns YES if the receiver has a title bar.
- [isFloatingPanel](#) (page 3642)  
Returns YES if the receiver is a floating panel.
- [isMiniaturizable](#) (page 3642)  
Returns YES if the receiver can be miniaturized (has a minimize button).
- [isModalPanel](#) (page 3642)  
Returns YES if the receiver is an application-modal panel.
- [isResizable](#) (page 3642)  
Returns YES if the receiver is resizable (has a size control).
- [isZoomable](#) (page 3643)  
Returns YES if the receiver is zoomable (has a zoom button).

### Setting Scripting Attribute Information for a Window

- [setIsMiniaturized:](#) (page 3643)  
Sets the receiver's miniaturized state to the value specified by *flag*.

- `setVisible:` (page 3644)  
Sets the receiver's visible state to the value specified by *flag*.
- `setZoomed:` (page 3644)  
Sets the receiver's zoomed state to the value specified by *flag*.

## Handling Script Commands

- `handleCloseScriptCommand:` (page 3640)  
Handles the `close` AppleScript command by attempting to close the window (and its associated document, if any).
- `handlePrintScriptCommand:` (page 3641)  
Handles the `print` AppleScript command by attempting to print the contents of the window (or its associated document, if any).
- `handleSaveScriptCommand:` (page 3641)  
Handles the `save` AppleScript command by attempting to save the window (and its associated document, if any).

## Working with Ordered Indices

- `orderedIndex` (page 3643)  
Returns the zero-based position of the receiver based on its order from front to back among all application windows.
- `setOrderedIndex:` (page 3644)  
Sets the zero-based position of the receiver, based on its order from front to back among all visible application windows, to the value specified by *index*. If *index* is out of range, sets the position to the nearest value that is in range.

## Instance Methods

### handleCloseScriptCommand:

Handles the `close` AppleScript command by attempting to close the window (and its associated document, if any).

- (id)handleCloseScriptCommand:(NSCloseCommand \*)*command*

#### Discussion

Extracts `close` command arguments from the *command* object and uses them to determine how to close the associated document—specifically, whether to ignore unsaved changes, save changes automatically, or ask the user and to identify the file in which to save the document (by default, the file that was opened or previously saved to, or an “untitled” name if the file has never been saved).

If there is a corresponding document and the window is the main window of the document, it forwards the `close` command to the corresponding document; otherwise, the window sends itself a `performClose` message, if it has a close box. This may have been handled differently in versions of Mac OS X prior to version 10.3.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindowScripting.h

## handlePrintScriptCommand:

Handles the `print` AppleScript command by attempting to print the contents of the window (or its associated document, if any).

```
- (id)handlePrintScriptCommand:(NSScriptCommand *)command
```

**Discussion**

If there is a corresponding document and the window is the main window of the document, it forwards the `print` command to the corresponding document; otherwise, the window sends itself a `print` message. This may have been handled differently in versions of Mac OS X prior to version 10.3.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindowScripting.h

## handleSaveScriptCommand:

Handles the `save` AppleScript command by attempting to save the window (and its associated document, if any).

```
- (id)handleSaveScriptCommand:(NSScriptCommand *)command
```

**Discussion**

The default version invokes the same named method of the window's document, if the window is the one being saved.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindowScripting.h

## hasCloseBox

Returns YES if the receiver has a close box.

```
- (BOOL)hasCloseBox
```

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindowScripting.h

## hasTitleBar

Returns YES if the receiver has a title bar.

- (BOOL)hasTitleBar

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

NSWindowScripting.h

## isFloatingPanel

Returns YES if the receiver is a floating panel.

- (BOOL)isFloatingPanel

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

NSWindowScripting.h

## isMiniaturizable

Returns YES if the receiver can be miniaturized (has a minimize button).

- (BOOL)isMiniaturizable

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

NSWindowScripting.h

## isModalPanel

Returns YES if the receiver is an application-modal panel.

- (BOOL)isModalPanel

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

NSWindowScripting.h

## isResizable

Returns YES if the receiver is resizable (has a size control).

- (BOOL)isResizable

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindowScripting.h

## isZoomable

Returns YES if the receiver is zoomable (has a zoom button).

- (BOOL)isZoomable

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindowScripting.h

## orderedIndex

Returns the zero-based position of the receiver based on its order from front to back among all application windows.

- (int)orderedIndex

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindowScripting.h

## setIsMiniaturized:

Sets the receiver's miniaturized state to the value specified by *flag*.

- (void)setIsMiniaturized:(BOOL)*flag*

**Discussion**

Depending on the current miniaturized state and the value of *flag*, the window may be minimized to the Dock or expanded from the Dock.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindowScripting.h

**setIsVisible:**

Sets the receiver's visible state to the value specified by *flag*.

- (void)setIsVisible:(BOOL)*flag*

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindowScripting.h

**setIsZoomed:**

Sets the receiver's zoomed state to the value specified by *flag*.

- (void)setIsZoomed:(BOOL)*flag*

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindowScripting.h

**setOrderedIndex:**

Sets the zero-based position of the receiver, based on its order from front to back among all visible application windows, to the value specified by *index*. If *index* is out of range, sets the position to the nearest value that is in range.

- (void)setOrderedIndex:(int)*index*

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSWindowScripting.h

# Functions

---

# Application Kit Functions Reference

---

**Framework:** AppKit/AppKit.h

## Overview

This document describes functions and function-like macros defined in the Application Kit framework.

## Functions by Task

### Accessibility

Additional information on accessibility can be found in `NSAccessibility`.

[NSAccessibilityActionDescription](#) (page 3652)

Returns a standard description for an action.

[NSAccessibilityPostNotification](#) (page 3652)

Sends a notification to any observing assistive applications.

[NSAccessibilityRaiseBadArgumentException](#) (page 3653)

Raises an error if the parameter is the wrong type or has an illegal value

[NSAccessibilityRoleDescription](#) (page 3653)

Returns a standard description for a role and subrole.

[NSAccessibilityRoleDescriptionForUIElement](#) (page 3654)

Returns a standard role description for a user interface element.

[NSAccessibilityUnignoredChildren](#) (page 3655)

Returns a list of unignored accessibility objects, descending the hierarchy if necessary.

[NSAccessibilityUnignoredChildrenForOnlyChild](#) (page 3655)

Returns a list of unignored accessibility objects, descending the hierarchy if necessary.

[NSAccessibilityUnignoredDescendant](#) (page 3655)

Returns an unignored accessibility object, descending the hierarchy if necessary.

[NSAccessibilityUnignoredAncestor](#) (page 3654)

Returns an unignored accessibility object, ascending the hierarchy if necessary.

### Applications

Additional information on `NSApplication` can be found in *NSApplication Class Reference*.

[NSApplicationLoad](#) (page 3656)

Startup function to call when running Cocoa code from a Carbon application.

[NSApplicationMain](#) (page 3656)

Called by the main function to create and run the application.

[NSPerformService](#) (page 3685)

Programmatically invokes a Services menu service.

[NSRegisterServiceProvider](#) (page 3692)

Registers a service provider.

[NSSetShowsServicesMenuItem](#) (page 3696)

Specifies whether an item should be included in Services menus.

[NSShowsServicesMenuItem](#) (page 3697)

Specifies whether a Services menu item is currently enabled.

[NSUnregisterServiceProvider](#) (page 3698)

Unregisters a service provider.

[NSUpdateDynamicServices](#) (page 3698)

Causes the services information for the system to be updated.

## Events

[NSEventMaskFromType](#) (page 3676)

Returns the event mask for the specified type.

## Fonts

[NSConvertGlyphsToPackedGlyphs](#) (page 3662)

Prepares a set of glyphs for processing by character-based routines.

## Graphics

[NSCopyBits](#) (page 3663)

Copies a bitmap image to the location specified by a destination point.

[NSCountWindows](#) (page 3663)

Counts the number of onscreen windows.

[NSCountWindowsForContext](#) (page 3664)

Counts the number of onscreen windows belonging to a particular application.

[NSDisableScreenUpdates](#) (page 3665)

Disables screen updates.

[NSEnableScreenUpdates](#) (page 3676)

Enables screen updates

[NSDottedFrameRect](#) (page 3665)

Draws a bordered rectangle.

[NSDrawBitmap](#) (page 3665)

Draws a bitmap image.

[NSDrawButton](#) (page 3667)

Draws a gray-filled rectangle representing a user-interface button.

[NSDrawDarkBezel](#) (page 3668)

Draws a dark gray-filled rectangle with a bezel border.

[NSDrawGrayBezel](#) (page 3669)

Draws a gray-filled rectangle with a bezel border.

[NSDrawGroove](#) (page 3669)

Draws a gray-filled rectangle with a groove border.

[NSDrawLightBezel](#) (page 3670)

Draws a white-filled rectangle with a bezel border.

[NSDrawThreePartImage](#) (page 3672)

Draws a three-part tiled image.

[NSDrawNinePartImage](#) (page 3670)

Draws a nine-part tiled image.

[NSDrawTiledRects](#) (page 3673)

Draws rectangles with borders.

[NSDrawColorTiledRects](#) (page 3667)

Draws a colored bordered rectangle.

[NSDrawWhiteBezel](#) (page 3675)

Draws a white-filled rectangle with a bezel border.

[NSDrawWindowBackground](#) (page 3675)

Draws the window's default background pattern into the specified rectangle of the currently focused view.

[NSEraseRect](#) (page 3676)

Erases the specified rect by filling it with white.

[NSFrameRect](#) (page 3677)

Draw a bordered rectangle.

[NSFrameRectWithWidth](#) (page 3678)

Draw a bordered rectangle.

[NSFrameRectWithWidthUsingOperation](#) (page 3678)

Draw a bordered rectangle using the specified compositing operation.

[NSGetWindowServerMemory](#) (page 3681)

Returns the amount of memory being used by a context.

[NSHighlightRect](#) (page 3682)

Highlights the specified rect by filling it with white.

[NSReadPixel](#) (page 3686)

Reads the color of the pixel at the specified location.

[NSRectClip](#) (page 3687)

Modifies the current clipping path by intersecting it with the passed rect.

[NSRectClipList](#) (page 3688)

Modifies the current clipping path by intersecting it with the passed rect.

[NSRectFill](#) (page 3688)

Fills the passed rectangle with the current color.

[NSRectFillList](#) (page 3689)

Fills the rectangles in the passed list with the current fill color.

[NSRectFillListWithColors](#) (page 3690)

Fills the rectangles in the passed list with the passed list of colors.

[NSRectFillListWithGrays](#) (page 3691)

Fills the rectangles in the passed list with the passed list of grays.

[NSRectFillListUsingOperation](#) (page 3689)

Fills the rectangles in a list using the current fill color and specified compositing operation.

[NSRectFillListWithColorsUsingOperation](#) (page 3690)

Fills the rectangles in a list using the specified colors and compositing operation.

[NSRectFillUsingOperation](#) (page 3692)

Fills a rectangle using the current fill color and the specified compositing operation.

[NSSetFocusRingStyle](#) (page 3696)

Specifies how a focus ring will be drawn.

[NSShowAnimationEffect](#) (page 3696)

Runs a system animation effect.

[NSWindowList](#) (page 3699)

Gets information about onscreen windows.

[NSWindowListForContext](#) (page 3699)

Gets information about an application's onscreen windows.

## Graphics-Window Depth

[NSAvailableWindowDepths](#) (page 3657)

Returns the available window depth values.

[NSBestDepth](#) (page 3661)

Attempts to return a window depth adequate for the specified parameters.

[NSBitsPerPixelFromDepth](#) (page 3661)

Returns the bits per pixel for the specified window depth.

[NSBitsPerSampleFromDepth](#) (page 3662)

Returns the bits per sample for the specified window depth.

[NSColorSpaceFromDepth](#) (page 3662)

Returns the name of the color space corresponding to the passed window depth.

[NSNumberOfColorComponents](#) (page 3684)

Returns the number of color components in the specified color space.

[NSPlanarFromDepth](#) (page 3686)

Returns whether the specified window depth is planar.

## Interface Styles

[NSInterfaceStyleForKey](#) (page 3683)

Returns an interface style value for the specified key and responder.

## Key Value Bindings

[NSIsControllerMarker](#) (page 3683)

Tests whether a given object is special marker object used for indicating the state of a selection in relation to a key.

## OpenGL

[NSOpenGLGetOption](#) (page 3684)

Returns global OpenGL options.

[NSOpenGLGetVersion](#) (page 3685)

Returns the NSOpenGL version numbers.

[NSOpenGLSetOption](#) (page 3685)

Sets global OpenGL options.

## Panels

[NSBeginAlertSheet](#) (page 3658)

Creates and runs an alert sheet.

[NSBeginCriticalAlertSheet](#) (page 3659)

Creates and runs a critical alert sheet.

[NSBeginInformationalAlertSheet](#) (page 3660)

Creates and runs an informational alert sheet.

[NSGetAlertPanel](#) (page 3679)

Returns an alert panel.

[NSGetCriticalAlertPanel](#) (page 3680)

Returns an alert panel to display a critical message.

[NSGetInformationalAlertPanel](#) (page 3681)

Returns an alert panel to display an informational message.

[NSReleaseAlertPanel](#) (page 3693)

Releases an alert panel.

[NSRunAlertPanel](#) (page 3693)

Creates an alert panel.

[NSRunCriticalAlertPanel](#) (page 3694)

Creates and runs a critical alert panel.

[NSRunInformationalAlertPanel](#) (page 3695)

Creates and runs an informational alert panel.

## Pasteboards

[NSCreateFileContentsPboardType](#) (page 3664)

Returns a pasteboard type based on the passed file type.

[NSCreateFilenamePboardType](#) (page 3664)

Returns a pasteboard type based on the passed file type.

[NSGetFileType](#) (page 3680)

Returns a file type based on the passed pasteboard type.

[NSGetFileTypes](#) (page 3680)

Returns an array of file types based on the passed pasteboard types.

## System Beep

Additional information on sounds can be found in [NSSound](#).

[NSBeep](#) (page 3658)

Plays the system beep.

## Functions

### NSAccessibilityActionDescription

Returns a standard description for an action.

```
NSString * NSAccessibilityActionDescription (
 NSString *action
);
```

#### Discussion

This function returns a standard description for *action*.

#### Availability

Available in Mac OS X v10.4 and later.

#### Related Sample Code

Dicey

ImageMapExample

#### Declared In

NSAccessibility.h

### NSAccessibilityPostNotification

Sends a notification to any observing assistive applications.

```
void NSAccessibilityPostNotification (
 id element,
 NSString *notification
);
```

**Discussion**

Sends *notification* to any assistive applications that have registered to receive the notification from the user interface object *element* in your application. Accessibility notifications require special handling, so they cannot be posted using `NSNotificationCenter`.

**Availability**

Available in Mac OS X v10.2 and later.

**Related Sample Code**

Dicey

TrackBall

**Declared In**

`NSAccessibility.h`

**NSAccessibilityRaiseBadArgumentException**

Raises an error if the parameter is the wrong type or has an illegal value

```
void NSAccessibilityRaiseBadArgumentException (
 id element,
 NSString *attribute,
 id value
);
```

**Discussion**

Raises an error if a parameter is the wrong type or has an illegal value. This function can also be used to raise an error if an attempt is made to set an attribute's value with the wrong type or an illegal value.

**Availability**

Available in Mac OS X v10.3 and later.

**Declared In**

`NSAccessibility.h`

**NSAccessibilityRoleDescription**

Returns a standard description for a role and subrole.

```
NSString * NSAccessibilityRoleDescription (
 NSString *role,
 NSString *subrole
);
```

**Discussion**

You should pass nil to this function if there is no subrole. This function returns a description of a standard role. For example, if you implement a button widget that does not inherit from `NSButton`, you should use this function to return a localized role description matching that returned by a standard button.

**Availability**

Available in Mac OS X v10.4 and later.

**Related Sample Code**

Dicey

ImageMapExample

TrackBall

**Declared In**

NSAccessibility.h

**NSAccessibilityRoleDescriptionForUIElement**

Returns a standard role description for a user interface element.

```
NSString * NSAccessibilityRoleDescriptionForUIElement (
 id element
);
```

**Discussion**

This function is like the [NSAccessibilityRoleDescription](#) (page 3653) function, except that it queries *element* to get the role and subrole. The `NSAccessibilityRoleDescription` function is more efficient, but this function is useful for accessorizing base classes so that they properly handle derived classes, which may override the subrole or even the role.

**Availability**

Available in Mac OS X v10.4 and later.

**Related Sample Code**

ImageMapExample

**Declared In**

NSAccessibility.h

**NSAccessibilityUnignoredAncestor**

Returns an unignored accessibility object, ascending the hierarchy if necessary.

```
id NSAccessibilityUnignoredAncestor (
 id element
);
```

**Discussion**

Tests whether *element* is an ignored object, returning either *element*, if it is not ignored, or the first unignored ancestor of *element*.

**Availability**

Available in Mac OS X v10.2 and later.

**Related Sample Code**

Dicey

ImageMapExample

TrackBall

**Declared In**

NSAccessibility.h

**NSAccessibilityUnignoredChildren**

Returns a list of unignored accessibility objects, descending the hierarchy if necessary.

```
NSArray * NSAccessibilityUnignoredChildren (
 NSArray *originalChildren
);
```

**Discussion**

Returns a copy of *originalChildren* with any ignored objects in the array replaced by their unignored descendants.

**Availability**

Available in Mac OS X v10.2 and later.

**Related Sample Code**

Dicey

ImageMapExample

**Declared In**

NSAccessibility.h

**NSAccessibilityUnignoredChildrenForOnlyChild**

Returns a list of unignored accessibility objects, descending the hierarchy if necessary.

```
NSArray * NSAccessibilityUnignoredChildrenForOnlyChild (
 id originalChild
);
```

**Discussion**

Tests whether *originalChild* is an ignored object and returns an array containing either *originalChild*, if it is not ignored, or its unignored descendants.

**Availability**

Available in Mac OS X v10.2 and later.

**Declared In**

NSAccessibility.h

**NSAccessibilityUnignoredDescendant**

Returns an unignored accessibility object, descending the hierarchy if necessary.

```
id NSAccessibilityUnignoredDescendant (
 id element
);
```

**Discussion**

Tests whether *element* is an ignored object, returning either *element*, if it is not ignored, or the first unignored descendant of *element*. Use this function only if you know there is a linear, one-to-one, hierarchy below *element*. Otherwise, if *element* has either no unignored children or multiple unignored children, this function fails and returns `nil`.

**Availability**

Available in Mac OS X v10.2 and later.

**Related Sample Code**

ImageMapExample

**Declared In**

NSAccessibility.h

**NSApplicationLoad**

Startup function to call when running Cocoa code from a Carbon application.

```
BOOL NSApplicationLoad (void);
```

**Return Value**

YES if the `NSApplication` object was successfully initialized and can now be used from your Carbon application or NO if there was an error during initialization.

**Discussion**

You typically call this function before calling other Cocoa code in a plug-in loaded into a primarily Carbon application. If the shared `NSApplication` object is not already initialized, this function initializes it and sets up the necessary event handlers for Cocoa.

**Availability**

Available in Mac OS X v10.2 and later.

**Related Sample Code**

CarbonCocoa\_PictureCursor

CarbonCocoaCoreImageTab

CarbonQuartzComposer\_TV

CocoaInCarbon

HIView-NSView

**Declared In**

NSApplication.h

**NSApplicationMain**

Called by the main function to create and run the application.

```
int NSApplicationMain (
 int argc,
 const char *argv[]
);
```

**Parameters***argc*

The number of arguments in the *argv* parameter.

*argv*

An array of pointers containing the arguments that were passed to the application at startup.

**Return Value**

This method never returns a result code. Instead, it calls the `exit` function to exit the application and terminate the process. If you want to determine why the application exited, you should look at the result code from the `exit` function instead.

**Discussion**

Creates the application, loads the main nib file from the application's main bundle, and runs the application. You must call this function from the main thread of your application, and you typically call it only once from your application's `main` function, which is usually generated automatically by Xcode.

**Special Considerations**

`NSApplicationMain` itself ignores the *argc* and *argv* arguments. Instead, Cocoa gets its arguments indirectly via `_NSGetArgv`, `_NSGetArgc`, and `_NSGetEnviron` (see `< crt_extens.h >`).

**Availability**

Available in Mac OS X v10.0 and later.

**Related Sample Code**

ImageClient

MyPhoto

Quartz EB

**Declared In**

`NSApplication.h`

**NSAvailableWindowDepths**

Returns the available window depth values.

```
const NSWindowDepth * NSAvailableWindowDepths (void);
```

**Discussion**

Returns a null-terminated array of `NSWindowDepth` [Window Depth](#) (page 3356) values that specify which window depths are currently available. Window depth values are converted to specific display properties using the functions `NSBitsPerPixelFromDepth` (page 3661), `NSBitsPerSampleFromDepth` (page 3662), `NSColorSpaceFromDepth` (page 3662), and `NSPlanarFromDepth` (page 3686).

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSGraphics.h

**NSBeep**

Plays the system beep.

```
void NSBeep (void);
```

**Discussion**

Plays the system beep. Users can select a sound to be played as the system beep. On a Macintosh computer, for example, you can change sounds with the Sound pane of System Preferences.

**Availability**

Available in Mac OS X v10.0 and later.

**Related Sample Code**

GridCalendar

NewsReader

PDFKitLinker2

Quartz Composer WWDC 2005 TextEdit

TextEditPlus

**Declared In**

NSGraphics.h

**NSBeginAlertSheet**

Creates and runs an alert sheet.

```
void NSBeginAlertSheet (
 NSString *title,
 NSString *defaultButton,
 NSString *alternateButton,
 NSString *otherButton,
 NSWindow *docWindow,
 id modalDelegate,
 SEL didEndSelector,
 SEL didDismissSelector,
 void *contextInfo,
 NSString *msg,
 ...
);
```

**Discussion**

Creates and runs an alert sheet on *docWindow*, with the title of *title*, the text of *msg*, and buttons with titles of *defaultButton*, *alternateButton*, and *otherButton*.

The buttons are laid out on the lower-right corner of the sheet, with *defaultButton* on the right, *alternateButton* on the left, and *otherButton* in the middle. If *title* is *nil* or an empty string, a default localized title is used (“Alert” in English). If *defaultButton* is *nil* or an empty string, a default localized button title (“OK” in English) is used. For the remaining buttons, this function creates them only if their corresponding button title is non-*nil*.

A Command-D key equivalent for the “Don’t Save” button is provided, if one is found. The button titles are searched for the localized value for “Don’t Save.” If a match is found, that button is assigned a Command-D key equivalent, provided it is not the default button.

If you create a modal panel using [runModalForWindow:](#) (page 164) or [beginSheet:modalForWindow:modalDelegate:didEndSelector:contextInfo:](#) (page 144), you can assign the key equivalent yourself, using [setKeyEquivalent:](#) (page 487) and [setKeyEquivalentModifierMask:](#) (page 488).

The *msg* argument is the message that’s displayed in the panel. It can use printf-style formatting characters; any necessary arguments should be listed at the end of the function’s argument list (after the *msg* argument). For more information on formatting characters, see the man page for `printf`.

When the modal session is ended, and before the sheet is dismissed, the *didEndSelector* is invoked on the *modalDelegate*, passing *contextInfo*. After the sheet is dismissed, the *didDismissSelector* is invoked on the *modalDelegate*, passing *contextInfo*. Typically, you will want to implement the *didEndSelector* but you may pass NULL for the *didDismissSelector*. The two selectors should be defined as follows:

```
sheetDidEnd:(NSWindow *)sheet returnCode:(int)returnCode contextInfo:(void *)contextInfo;
sheetDidDismiss:(NSWindow *)sheet returnCode:(int)returnCode contextInfo:(void *)contextInfo;
```

where *sheet* is the alert sheet, *returnCode* specifies which button the user pressed, and *contextInfo* is the same *contextInfo* passed into `NSBeginAlertSheet`. *returnCode* can be one of the following:

- `NSAlertDefaultReturn` means the user pressed the default button.
- `NSAlertAlternateReturn` means the user pressed the alternate button.
- `NSAlertOtherReturn` means the user pressed the other button.
- `NSAlertErrorReturn` means an error occurred while running the alert panel.

## NSBeginCriticalAlertSheet

Creates and runs a critical alert sheet.

```
void NSBeginCriticalAlertSheet (
 NSString *title,
 NSString *defaultButton,
 NSString *alternateButton,
 NSString *otherButton,
 NSWindow *docWindow,
 id modalDelegate,
 SEL didEndSelector,
 SEL didDismissSelector,
 void *contextInfo,
 NSString *msg,
 ...
);
```

**Discussion**

Creates and runs a critical alert sheet on *docWindow*, with the title of *title*, the text of *msg*, and buttons with titles of *defaultButton*, *alternateButton*, and *otherButton*.

See the description of [NSBeginAlertSheet](#) (page 3658) for information on layout, default parameters, and the selectors.

The sheet presented to the user is badged with a caution icon. Critical alerts should be used only as specified in the "Alerts" section of the Windows chapter of *Apple Human Interface Guidelines*.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSPanel.h

**NSBeginInformationalAlertSheet**

Creates and runs an informational alert sheet.

```
void NSBeginInformationalAlertSheet (
 NSString *title,
 NSString *defaultButton,
 NSString *alternateButton,
 NSString *otherButton,
 NSWindow *docWindow,
 id modalDelegate,
 SEL didEndSelector,
 SEL didDismissSelector,
 void *contextInfo,
 NSString *msg,
 ...
);
```

**Discussion**

Creates and runs an informational alert sheet on *docWindow*, with the title of *title*, the text of *msg*, and buttons with titles of *defaultButton*, *alternateButton*, and *otherButton*.

See the description of [NSBeginAlertSheet](#) (page 3658) for information on layout, default parameters, and the selectors.

**Availability**

Available in Mac OS X v10.0 and later.

**Related Sample Code**

AutoSample

InstallerPluginSample

**Declared In**

NSPanel.h

**NSBestDepth**

Attempts to return a window depth adequate for the specified parameters.

```
NSWindowDepth NSBestDepth (
 NSString *colorSpace,
 NSInteger bps,
 NSInteger bpp,
 BOOL planar,
 BOOL *exactMatch
);
```

**Discussion**

Returns a window depth deep enough for the given number of colors in *colorSpace*, bits per sample specified by *bps*, bits per pixel specified by *bpp*, and whether planar as specified by *planar*. Upon return, the variable pointed to by *exactMatch* is YES if the window depth can accommodate all of the values specified by the parameters, NO if it can't.

Use this function to compute window depths. This function tries to accommodate all the parameters (match or better); if there are multiple matches, it gives the closest, with matching *colorSpace* first, then *bps*, then *planar*, then *bpp*. *bpp* is “bits per pixel”; 0 indicates default (same as the number of bits per plane, either *bps* or *bps* \* [NSNumberOfColorComponents](#) (page 3684)); other values may be used as hints to provide backing stores of different configuration; for instance, 8-bit color. The *exactMatch* parameter is optional and indicates whether all the parameters matched exactly.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSGraphics.h

**NSBitsPerPixelFromDepth**

Returns the bits per pixel for the specified window depth.

```
NSInteger NSBitsPerPixelFromDepth (
 NSWindowDepth depth
);
```

**Discussion**

Returns the number of bits per pixel for the window depth specified by *depth*.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSGraphics.h

**NSBitsPerSampleFromDepth**

Returns the bits per sample for the specified window depth.

```
NSInteger NSBitsPerSampleFromDepth (
 NSWindowDepth depth
);
```

**Discussion**

Returns the number of bits per sample (bits per pixel in each color component) for the window depth specified by *depth*.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSGraphics.h

**NSColorSpaceFromDepth**

Returns the name of the color space corresponding to the passed window depth.

```
NSString * NSColorSpaceFromDepth (
 NSWindowDepth depth
);
```

**Discussion**

Returns the color space name for the specified *depth*. For example, the returned color space name can be `NSCalibratedRGBColorSpace`, or `NSDeviceCMYKColorSpace`.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSGraphics.h

**NSConvertGlyphsToPackedGlyphs**

Prepares a set of glyphs for processing by character-based routines.

```

NSInteger NSConvertGlyphsToPackedGlyphs (
 NSGlyph *glBuf,
 NSInteger count,
 NSMultibyteGlyphPacking packing,
 char *packedGlyphs
);

```

**Discussion**

Takes a buffer of glyphs, specified in the *glBuf* parameter, and packs them into a condensed character array. The character array is returned in the *packedGlyphs* parameter, which should have enough space for at least  $((4 * \text{count}) + 1)$  bytes to guarantee that the packed glyphs fit. *count* specifies the number of glyphs in *glBuf*. *packing* specifies how the glyphs are currently packed.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSFont.h

**NSCopyBits**

Copies a bitmap image to the location specified by a destination point.

```

void NSCopyBits (
 NSInteger srcGState,
 NSRect srcRect,
 NSPoint destPoint
);

```

**Discussion**

Copies the pixels in the rectangle specified by *srcRect* to the location specified by *destPoint*. The source rectangle is defined in the graphics state designated by *srcGState*. If *srcGState* is `NSNullObject`, the current graphics state is assumed. The *destPoint* destination is defined in the current graphics state.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSGraphics.h

**NSCountWindows**

Counts the number of onscreen windows.

```

void NSCountWindows (
 NSInteger *count
);

```

**Parameters**

*count*

On output, this parameter contains the number of onscreen windows.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSGraphics.h

**NSCountWindowsForContext**

Counts the number of onscreen windows belonging to a particular application.

```
void NSCountWindowsForContext (
 NSInteger context,
 NSInteger *count
);
```

**Discussion**

Counts the number of onscreen windows belonging to a particular application, identified by *context*, which is a window server connection ID. The function returns the number by reference in *count*.

Use of this function is discouraged as it may be deprecated in a future release.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSGraphics.h

**NSCreateFileContentsPboardType**

Returns a pasteboard type based on the passed file type.

```
NSString * NSCreateFileContentsPboardType (
 NSString *fileType
);
```

**Discussion**

Returns an NSString to a pasteboard type representing a file's contents based on the supplied string *fileType*. *fileType* should generally be the extension part of a filename. The conversion from a named file type to a pasteboard type is simple; no mapping to standard pasteboard types is attempted.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSPasteboard.h

**NSCreateFilenamePboardType**

Returns a pasteboard type based on the passed file type.

```
NSString * NSCreateFilenamePboardType (
 NSString *fileType
);
```

**Discussion**

Returns an NSString to a pasteboard type representing a filename based on the supplied string *fileType*.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSPasteboard.h

**NSDisableScreenUpdates**

Disables screen updates.

```
void NSDisableScreenUpdates (void);
```

**Discussion**

Prevents drawing operations from being flushed to the screen for all windows belonging to the calling process. When you re-enable screen updates (with [NSEnableScreenUpdates](#) (page 3676)) screen flushing for all windows belonging to the calling process appears to be simultaneous. You typically call this function so that operations on multiple windows appear atomic to the user. This is a technique particularly useful for synchronizing parent and child windows. Make sure that the period after calling this function and before reenabling updates is short; the system only allow updating to be disabled for a limited time (currently one second) before automatically reenabling updates. Successive calls to this function are placed on a stack and must be popped off that stack by matching [NSEnableScreenUpdates](#) calls.

**Availability**

Available in Mac OS X v10.3 and later.

**Declared In**

NSGraphics.h

**NSDottedFrameRect**

Draws a bordered rectangle.

```
void NSDottedFrameRect (
 NSRect aRect
);
```

**Discussion**

Deprecated. Use a dashed [NSBezierPath](#) instead.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

[NSDrawTiledRects](#) (page 3673)

**Declared In**

NSGraphics.h

**NSDrawBitmap**

Draws a bitmap image.

```
void NSDrawBitmap (
 NSRect rect,
 NSInteger width,
 NSInteger height,
 NSInteger bps,
 NSInteger spp,
 NSInteger bpp,
 NSInteger bpr,
 BOOL isPlanar,
 BOOL hasAlpha,
 NSString *colorSpaceName,
 const unsigned char *const data[5]
);
```

### Discussion

This function is marginally obsolete. Most applications are better served using the `NSBitmapImageRep` class to read and display bitmap images.

This function renders an image from a bitmap, binary data that describes the pixel values for the image.

This function renders a bitmap image using an appropriate display operator. It puts the image in the rectangular area specified by its first argument, *rect*; the rectangle is specified in the current coordinate system and is located in the current window. The next two arguments, *pixelsWide* and *pixelsHigh*, give the width and height of the image in pixels. If either of these dimensions is larger or smaller than the corresponding dimension of the destination rectangle, the image will be scaled to fit.

The remaining arguments describe the bitmap data, as explained in the following paragraphs.

The *bitsPerSample* argument is the number of bits per sample for each pixel and *samplesPerPixel* is the number of samples per pixel. *bitsPerPixel* is based on *samplesPerPixel* and the configuration of the bitmap: if the configuration is planar, then the value of *bitsPerPixel* should equal the value of *bitsPerSample*; if the configuration isn't planar (is meshed instead), *bitsPerPixel* should equal *bitsPerSample* \* *samplesPerPixel*.

The *bytesPerRow* argument is calculated in one of two ways, depending on the configuration of the image data (data configuration is described below). If the data is planar, *bytesPerRow* is  $(7 + (\text{pixelsWide} * \text{bitsPerSample})) / 8$ . If the data is meshed, *bytesPerRow* is  $(7 + (\text{pixelsWide} * \text{bitsPerSample} * \text{samplesPerPixel})) / 8$ .

A sample is data that describes one component of a pixel. In an RGB color system, the red, green, and blue components of a color are specified as separate samples, as are the cyan, magenta, yellow, and black components in a CMYK system. Color values in a grayscale are a single sample. Alpha values that determine transparency and opaqueness are specified as a coverage sample separate from color. In bitmap images with alpha, the color (or gray) components have to be premultiplied with the alpha. This is the way images with alpha are displayed, this is the way they are read back, and this is the way they are stored in TIFFs.

The *isPlanar* argument refers to the way data is configured in the bitmap. This flag should be set to YES if a separate data channel is used for each sample. The function provides for up to five channels, *data1*, *data2*, *data3*, *data4*, and *data5*. It should be set NO if sample values are interwoven in a single channel (meshed); all values for one pixel are specified before values for the next pixel.

Grayscale windows store pixel data in planar configuration; color windows store it in meshed configuration. `NSDrawBitmap` can render meshed data in a planar window, or planar data in a meshed window. However, it's more efficient if the image has a depth (*bitsPerSample*) and configuration (*isPlanar*) that match the window.

The *hasAlpha* argument indicates whether the image contains alpha. If it does, the number of samples should be 1 greater than the number of color components in the model (for example, 4 for RGB).

The *colorSpace* argument can be `NSCustomColorSpace`, indicating that the image data is to be interpreted according to the current color space in the graphics state. This allows for imaging using custom color spaces. The image parameters supplied as the other arguments should match what the color space is expecting.

If the image data is planar, *data*[0] through *data*[*samplesPerPixel*–1] point to the planes; if the *data* is meshed, only *data*[0] needs to be set.

#### Availability

Available in Mac OS X v10.0 and later.

#### Declared In

`NSGraphics.h`

## NSDrawButton

Draws a gray-filled rectangle representing a user-interface button.

```
void NSDrawButton (
 NSRect aRect,
 NSRect clipRect
);
```

#### Parameters

*aRect*

The bounding rectangle (in the current coordinate system) in which to draw. Only those parts of *aRect* that lie within the *clipRect* are actually drawn.

*clipRect*

The clipping rectangle to use during drawing.

#### Discussion

Draws a gray-filled rectangle, used to signify a user-interface button. Since this function is often used to draw the border of a view, the *aRect* parameter typically contains the view's bounds rectangle. For an Aqua button, use an `NSButton` object instead.

This function fills the specified rectangle with light gray. This function is designed for rectangles that are defined in unscaled, unrotated coordinate systems (that is, where the y axis is vertical, the x axis is horizontal, and a unit along either axis is equal to 1 screen pixel). The coordinate system can be either flipped or unflipped. The sides of the rectangle should lie on pixel boundaries.

#### Availability

Available in Mac OS X v10.0 and later.

#### Declared In

`NSGraphics.h`

## NSDrawColorTiledRects

Draws a colored bordered rectangle.

```

NSRect NSDrawColorTiledRects (
 NSRect boundsRect,
 NSRect clipRect,
 const NSRectEdge *sides,
 NSColor **colors,
 NSInteger count
);

```

**Parameters***boundsRect*

The bounding rectangle (in the current coordinate system) in which to draw. Since this function is often used to draw the border of a view, this rectangle will typically be that view's bounds rectangle. Only those parts of *boundsRect* that lie within the *clipRect* are actually drawn.

*clipRect*

The clipping rectangle to use during drawing.

*sides*

The sides of the rectangle for which you want to specify custom colors. Each side must have a corresponding entry in the *colors* parameter.

*colors*

The colors to draw for each of the edges listed in the *sides* parameter.

*count*

The number of 1.0-unit-wide slices to draw on the specified sides.

**Return Value**

The rectangle that lies within the resulting border.

**Discussion**

Behaves the same as [NSDrawTiledRects](#) (page 3673) except it draws its border using colors from the *colors* array.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSGraphics.h

**NSDrawDarkBezel**

Draws a dark gray-filled rectangle with a bezel border.

```

void NSDrawDarkBezel (
 NSRect aRect,
 NSRect clipRect
);

```

**Parameters***aRect*

The bounding rectangle (in the current coordinate system) in which to draw. Only those parts of *aRect* that lie within the *clipRect* are actually drawn.

*clipRect*

The clipping rectangle to use during drawing.

**Availability**

Available in Mac OS X v10.0 and later.

**See Also**

**Related Sample Code**

BindingsJoystick

**Declared In**

NSGraphics.h

**NSDrawNinePartImage**

Draws a nine-part tiled image.

```
void NSDrawNinePartImage(NSRect frame,
 NSImage *topLeftCorner,
 NSImage *topEdgeFill,
 NSImage *topRightCorner,
 NSImage *leftEdgeFill,
 NSImage *centerFill,
 NSImage *rightEdgeFill,
 NSImage *bottomLeftCorner,
 NSImage *bottomEdgeFill,
 NSImage *bottomRightCorner,
 NSCompositingOperation op,
 CGFloat alphaFraction,
 BOOL flipped
);
```

**Parameters***frame*

The rectangle (specified in the current coordinate system) in which to draw the images.

*topLeftCorner*

The image to display in the top-left corner.

*topEdgeFill*

The image used to tile the space between the *topLeftCorner* and *topRightCorner* images.

*topRightCorner*

The image to display in the top-right corner.

*leftEdgeFill*

The image used to tile the space between the *topLeftCorner* and *bottomLeftCorner* images.

*centerFill*

The image used to tile the center area between the other eight images.

*rightEdgeFill*

The image used to tile the space between the *topRightCorner* and *bottomRightCorner* images.

*bottomLeftCorner*

The image to display in the bottom-left corner.

*bottomEdgeFill*

The image used to tile the space between the *bottomLeftCorner* and *bottomRightCorner* images.

*bottomRightCorner*

The image to display in the bottom-right corner.

*op*

The compositing operation to use when rendering the images.

*alphaFraction*

The alpha value to apply to the rendered image. This value can range between 0.0 and 1.0, with 0.0 being fully transparent and 1.0 being fully opaque.

*flipped*

Specify YES if you are drawing the images in a flipped coordinate system; otherwise, specify NO.

**Discussion**

This function is typically used to draw custom cells that are capable of being resized both vertically and horizontally. Cells of this type are comprised of four fixed-size corner images along and a set of edge and center images that are used to fill the gaps between the corners. These cells allow you to create sophisticated looking controls that can grow and shrink in any direction without distorting the control's overall appearance.

You should prefer the use of this function over your own custom code for handling multi-part images whose size can change. This function correctly manages the subtle behaviors needed to handle resolution independence issues and to avoid visual artifacts caused by tiling the various images.

This function uses the top-left and bottom-right corner images to determine the widths and heights of the edge areas that need to be filled. If the width or height of the bottom-left and top-right images are not sized appropriately, they may be scaled to fill their corner area. Edge areas between the corners are tiled using the corresponding image. Similarly, the center area is tiled using the specified center image.

The *flipped* parameter lets you reorient the contents of each image when drawing in a flipped coordinate system. By default, images use an internal coordinate system that is not flipped. Rendering such an image in a flipped coordinate system would therefore cause the image to appear upside down. Passing YES for the *flipped* parameter adjusts the image's internal coordinate system to draw it correctly in a flipped environment.

#### Availability

Available in Mac OS X v10.5 and later.

#### Declared In

NSCell.h

## NSDrawThreePartImage

Draws a three-part tiled image.

```
void NSDrawThreePartImage(NSRect frame,
 NSImage *startCap,
 NSImage *centerFill,
 NSImage *endCap,
 BOOL vertical,
 NSCompositingOperation op,
 CGFloat alphaFraction,
 BOOL flipped
);
```

#### Parameters

*frame*

The rectangle (specified in the current coordinate system) in which to draw the images.

*startCap*

For a horizontal three-part image, this is the image located at the left edge of the frame rectangle. For a vertical three-part image, this image appears at the top of the screen in an unflipped coordinate system and at the bottom of the screen in a flipped coordinate system.

*centerFill*

The image used to tile the space between the *startCap* and *endCap* images.

*endCap*

For a horizontal three-part image, this is the image located at the right edge of the frame rectangle. For a vertical three-part image, this image appears at the bottom of the screen in an unflipped coordinate system and at the top of the screen in a flipped coordinate system.

*vertical*

Specify YES if the images should be stacked on top of one another to create a vertically oriented element. Specify NO if the images should be laid out side-by-side to create a horizontally oriented element.

*op*

The compositing operation to use when rendering the images.

*alphaFraction*

The alpha value to apply to the rendered image. This value can range between 0.0 and 1.0, with 0.0 being fully transparent and 1.0 being fully opaque.

*flipped*

Specify YES if you are drawing the images in a flipped coordinate system; otherwise, specify NO.

**Discussion**

This function is typically used to draw custom cells (such as the backgrounds for push button and slider controls) that are capable of being resized along a single axis only. Cells of this type are comprised of fixed-size end cap images and a center area that is filled by tiling the specified center image as many times as needed to fill the gap. These cells allow you to create sophisticated looking controls that can grow and shrink without distorting the control's overall appearance.

You should prefer the use of this function over your own custom code for handling multi-part images whose size can change. This function correctly manages the subtle behaviors needed to handle resolution independence issues and to avoid visual artifacts caused by tiling the various images.

When drawing a horizontally oriented control, the images in the *startCap*, *centerFill*, and *endCap* parameters should all have the same height, and that height should match the height of the frame rectangle. If an image's height does not match the height of the frame rectangle, it is scaled until it does match, which might yield less desirable results. For vertically oriented controls, the image widths are scaled instead of the heights.

The *flipped* parameter lets you reorient the contents of each image when drawing in a flipped coordinate system. By default, images use an internal coordinate system that is not flipped. Rendering such an image in a flipped coordinate system would therefore cause the image to appear upside down. Passing YES for the *flipped* parameter adjusts the image's internal coordinate system to draw it correctly in a flipped environment.

**Availability**

Available in Mac OS X v10.5 and later.

**Declared In**

NSCell.h

**NSDrawTiledRects**

Draws rectangles with borders.

```

NSRect NSDrawTiledRects (
 NSRect boundsRect,
 NSRect clipRect,
 const NSRectEdge *sides,
 const CGFloat *grays,
 NSInteger count
);

```

**Parameters***boundsRect*

The bounding rectangle (in the current coordinate system) in which to draw. Since this function is often used to draw the border of a view, this rectangle will typically be that view's bounds rectangle. Only those parts of *boundsRect* that lie within the *clipRect* are actually drawn.

*clipRect*

The clipping rectangle to use during drawing.

*sides*

The sides of the rectangle for which you want to specify custom gray levels. Each side must have a corresponding entry in the *grays* parameter.

*grays*

The gray levels to draw for each of the edges listed in the *sides* parameter.

*count*

The number of 1.0-unit-wide slices to draw on the specified sides.

**Return Value**

The rectangle that lies within the resulting border.

**Discussion**

This is a generic function that can be used to draw different types of borders inside a given rectangle. These borders can be used to outline an area or to give rectangles the effect of being recessed from or elevated above the surface of the screen.

The *sides*, *grays*, and *count* parameters determine how thick the border is and what gray levels are used to form it. This function uses the `NSDivideRect` function to take successive 1.0-unit-wide slices from the sides of the rectangle specified by the *sides* parameter. Each slice is drawn using the corresponding gray level from the *grays* parameter. This function makes and draws these slices *count* number of times. If you specify the same side more than once, the second slice is drawn inside the first.

The following example uses this function to draw a beveled border consisting of a 1.0-unit-wide white line at the top and on the left side and a 1.0-unit-wide dark-gray line inside a 1.0-unit-wide black line on the other two sides. The resulting rectangle inside this border is then filled in using light gray.

```

NSRectEdge mySides[] = {NSMinYEdge, NSMaxXEdge, NSMaxYEdge, NSMinXEdge,
 NSMinYEdge, NSMaxXEdge};
float myGrays[] = {NSBlack, NSBlack, NSWhite, NSWhite,
 NSDarkGray, NSDarkGray};
NSRect aRect, clipRect; // Assume exists

aRect = NSDrawTiledRects(aRect, clipRect, mySides, myGrays, 6);
[[NSColor grayColor] set];
NSRectFill(aRect);

```

In the preceding example, *mySides* is an array that specifies sides of a rectangle; for example, `NSMinYEdge` selects the side parallel to the x axis with the smallest y coordinate value. *myGrays* is an array that specifies the successive gray levels to be used in drawing parts of the border.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSGraphics.h

**NSDrawWhiteBezel**

Draws a white-filled rectangle with a bezel border.

```
void NSDrawWhiteBezel (
 NSRect aRect,
 NSRect clipRect
);
```

**Parameters**

*aRect*

The bounding rectangle (in the current coordinate system) in which to draw. Only those parts of *aRect* that lie within the *clipRect* are actually drawn.

*clipRect*

The clipping rectangle to use during drawing.

**Availability**

Available in Mac OS X v10.0 and later.

NSGraphics.h

## NSEnableScreenUpdates

Enables screen updates

```
void NSEnableScreenUpdates (void);
```

### Discussion

Reenables, for all windows of a process, the flushing of drawing operations to the screen that was previously disabled by [NSDisableScreenUpdates](#) (page 3665). Successive calls to `NSDisableScreenUpdates` are placed on a stack and must be popped off that stack by matching calls to this function.

### Availability

Available in Mac OS X v10.3 and later.

### Declared In

`NSGraphics.h`

## NSEraseRect

Erases the specified rect by filling it with white.

```
void NSEraseRect (
 NSRect aRect
);
```

### Parameters

*aRect*

The rectangle (in the current coordinate system) defining the area to erase.

### Discussion

This function fills the specified rectangle with white. It does not alter the current color.

### Availability

Available in Mac OS X v10.0 and later.

### Related Sample Code

Quartz EB

### Declared In

`NSGraphics.h`

## NSEventMaskFromType

Returns the event mask for the specified type.

```
static NSUInteger NSEventMaskFromType (
 NSEventType type
);
```

### Parameters

*type*

The event type whose mask you want to get.

**Return Value**

The event mask corresponding to the specified type. The returned mask is equivalent to the number 1 left-shifted by *type* bits.

**Availability**

Available in Mac OS X v10.0 and later.

**Related Sample Code**

Quartz Composer Matrix

**Declared In**

NSEvent.h

**NSFrameRect**

Draw a bordered rectangle.

```
void NSFrameRect (
 NSRect aRect
);
```

**Parameters**

*aRect*

The bounding rectangle (in the current coordinate system) in which to draw.

**Discussion**

Draws a frame around the inside of *aRect* in the current color and using the `NSCompositeCopy` compositing operation. The width is equal to 1.0 in the current coordinate system. Since the frame is drawn inside the rectangle, it will be visible even if drawing is clipped to the rectangle.

Because this function does not draw directly on the line, but rather inside it, it uses the current fill color (not stroke color) when drawing.

For a list of compositing operations and how you use them, see *Cocoa Drawing Guide*.

**Availability**

Available in Mac OS X v10.0 and later.

**NSFrameRectWithWidth**

Draw a bordered rectangle.

```
void NSFrameRectWithWidth (
 NSRect aRect,
 CGFloat frameWidth
);
```

**Parameters**

*aRect*

The bounding rectangle (in the current coordinate system) in which to draw.

*frameWidth*

The width of the frame, specified in points.

**Discussion**

Draws a frame around the inside of *aRect* in the current color and using the `NSCompositeCopy` compositing operation. The width is equal to *frameWidth* in the current coordinate system. Since the frame is drawn inside the rectangle, it will be visible even if drawing is clipped to the rectangle.

Because this function does not draw directly on the line, but rather inside it, it uses the current fill color (not stroke color) when drawing.

For a list of compositing operations and how you use them, see *Cocoa Drawing Guide*.

**NSFrameRectWithWidthUsingOperation**

Draw a bordered rectangle using the specified compositing operation.

```
void NSFrameRectWithWidthUsingOperation (
 NSRect aRect,
 CGFloat frameWidth,
 NSCompositingOperation op
);
```

**Parameters**

*aRect*

The bounding rectangle (in the current coordinate system) in which to draw.

*frameWidth*

The width of the frame, specified in points.

*op*

The compositing operation to use when drawing the frame.

**Discussion**

Draws a frame around the inside of *aRect* in the current color, using the compositing operation *op*. The width is equal to *frameWidth* in the current coordinate system. Since the frame is drawn inside the rectangle, it will be visible even if drawing is clipped to the rectangle.

Because this function does not draw directly on the line, but rather inside it, it uses the current fill color (not stroke color) when drawing.

For a list of compositing operations and how you use them, see *Cocoa Drawing Guide*.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSGraphics.h

**NSGetAlertPanel**

Returns an alert panel.

```
id NSGetAlertPanel (
 NSString *title,
 NSString *msg,
 NSString *defaultButton,
 NSString *alternateButton,
 NSString *otherButton,
 ...
);
```

**Discussion**

Returns an `NSPanel` that can be used to set up a modal session. A modal session is useful for allowing the user to interrupt the program. During a modal session, you can perform activities while the panel is displayed and check at various points in your program whether the user has clicked one of the panel's buttons. The arguments for this function are the same as those for `NSRunAlertPanel` (page 3693), but unlike that function, no button is displayed if *defaultButton* is `nil`.

To set up a modal session, send the Application object `beginModalSessionForWindow:` (page 143) with the panel returned by `NSGetAlertPanel` as its argument. When you want to check if the user has clicked one of the panel's buttons, use `runModalSession:` (page 165). To end the modal session, use `endModalSession:` (page 149). When you're finished with the panel created by `NSGetAlertPanel`, you must free it by passing it to `NSReleaseAlertPanel` (page 3693).

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSPanel.h

## NSGetCriticalAlertPanel

Returns an alert panel to display a critical message.

```
id NSGetCriticalAlertPanel (
 NSString *title,
 NSString *msg,
 NSString *defaultButton,
 NSString *alternateButton,
 NSString *otherButton,
 ...
);
```

### Discussion

Returns an `NSPanel` that can be used to set up a modal session. No button is displayed if `defaultButton` is `nil`. When you're finished with the panel created by this function, you must free it by passing it to [NSReleaseAlertPanel](#) (page 3693).

The arguments for this function are the same as those for the [NSGetAlertPanel](#) (page 3679). For more information on using a panel in a modal session, see `NSGetAlertPanel`.

The panel presented to the user is badged with a caution icon. Critical alerts should be used only as specified in the "Alerts" section of the Windows chapter of *Apple Human Interface Guidelines*.

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

`NSPanel.h`

## NSGetFileType

Returns a file type based on the passed pasteboard type.

```
NSString * NSGetFileType (
 NSString *pboardType
);
```

### Discussion

This function is the inverse of both [NSCreateFileContentsPboardType](#) (page 3664) and [NSCreateFilenamePboardType](#) (page 3664). When passed a pasteboard type as returned by those functions, it returns the extension or filename from which the type was derived. It returns `nil` if `pboardType` isn't a pasteboard type created by those functions.

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

`NSPasteboard.h`

## NSGetFileTypes

Returns an array of file types based on the passed pasteboard types.

```
NSArray * NSGetFileTypes (
 NSArray *pboardTypes
);
```

**Discussion**

Accepts a null-terminated array of pointers to pasteboard types and returns a null-terminated array of the unique extensions and filenames from the file content and filename types found in the input array. It returns `nil` if the input array contains no file content or filename types. The returned array is allocated and must be freed by the caller. The pointers in the return array point into strings passed in the input array.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSPasteboard.h`

**NSGetInformationalAlertPanel**

Returns an alert panel to display an informational message.

```
id NSGetInformationalAlertPanel (
 NSString *title,
 NSString *msg,
 NSString *defaultButton,
 NSString *alternateButton,
 NSString *otherButton,
 ...
);
```

**Discussion**

Returns an `NSPanel` that can be used to set up a modal session. No button is displayed if *defaultButton* is `nil`. When you're finished with the panel created by this function, you must free it by passing it to [NSReleaseAlertPanel](#) (page 3693).

The arguments for this function are the same as those for the [NSRunAlertPanel](#) (page 3693) function. For more information on using a panel in a modal session, see [NSGetAlertPanel](#) (page 3679).

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSPanel.h`

**NSGetWindowServerMemory**

Returns the amount of memory being used by a context.

```

NSInteger NSGetWindowServerMemory (
 NSInteger context,
 NSInteger *virtualMemory,
 NSInteger *windowBackingMemory,
 NSString **windowDumpString
);

```

**Discussion**

Calculates the amount of memory being used at the moment by the given *context*. If `NULL` is passed for *context*, the current context is used. The amount of virtual memory used by the current context is returned in the int pointed to by *virtualMemory*; the amount of window backing store used by windows owned by the current context is returned in the int pointed to by *windowBackingMemory*. The sum of these two numbers is the amount of the memory that this context is responsible for.

Calculating these numbers takes some time to execute; thus, calling this function in normal operation is not recommended.

If `nil` is not passed in for *windowDumpStream*, the information returned is echoed to the specified stream. This fact can be useful for finding out more about which windows are using up your storage.

Normally, `NSGetWindowServerMemory` returns 0. If `NULL` is passed for *context* and there's no current display context, this function returns -1.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSGraphics.h`

**NSHighlightRect**

Highlights the specified rect by filling it with white.

```

void NSHighlightRect (
 NSRect aRect
);

```

**Parameters**

*aRect*

The bounding rectangle (in the current coordinate system) in which to draw.

**Discussion**

Highlights the rectangle referred to by *aRect*. Light gray becomes white, and white becomes light gray. This function must be called twice, once to highlight the rectangle and once to unhighlight it; the rectangle should not be left in its highlighted state. When not drawing on the screen, the compositing operation is replaced by one that fills the rectangle with light gray.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSGraphics.h`

## NSInterfaceStyleForKey

Returns an interface style value for the specified key and responder.

```
NSInterfaceStyle NSInterfaceStyleForKey (
 NSString *key,
 NSResponder *responder
);
```

### Discussion

Used to determine an interface style based on a key and a responder, either of which may be `nil`. An [NSInterfaceStyle](#) (page 3705) value specifies the style in which an interface item, such as a button or a scroll bar, should be drawn. For example, a value of `NSMacintoshInterfaceStyle` indicates an item should be drawn in the Macintosh style. The values defined for `NSInterfaceStyle` are `NSNoInterfaceStyle`, `NSNextStepInterfaceStyle`, `NSWindows95InterfaceStyle`, and `NSMacintoshInterfaceStyle`. Note that this function never returns `NSNoInterfaceStyle`.

The interface style value returned by this function depends on several factors. If responder is not `nil` and if responder specifies an interface style other than `NSNoInterfaceStyle`, this function returns the responder's style, and `key` is ignored.

Otherwise, if `key` is not `nil` and there is an interface style for `key` specified by the defaults system, this function returns the interface style for `key` from the defaults system.

Finally, if `key` is `nil`, or if there is no interface style for `key` specified by the defaults system, this function returns the global interface style specified by the defaults system.

The defaults system allows an application to customize its behavior to match a user's preferences. You can read about the defaults system in the documentation for `NSUserDefaults`.

## NSIsControllerMarker

Tests whether a given object is special marker object used for indicating the state of a selection in relation to a key.

```
BOOL NSIsControllerMarker (
 id object
);
```

### Parameters

*Term*

Specify the object you want to check. This parameter can be `nil`.

### Return Value

YES if the object is one of the designated controller markers or NO if it is not.

**Discussion**

This function helps you to create bindings between user interface elements and controller objects. The Application Kit predefines several special marker objects used as values for indicating selection state; currently these are `NSMultipleValuesMarker`, `NSNoSelectionMarker`, and `NSNotApplicableMarker`. These markers are typed as `id` and only exist for the purpose of indicating a state; they are never archived and cannot be used as object values in controls. You use this function to test whether a given object value is a marker, in which case it is not directly assignable to the object that is bound. This check is important, especially since additional markers may be added in the future.

See the `NSKeyValueBinding.h` header file for further details.

**Availability**

Available in Mac OS X v10.3 and later.

**Related Sample Code**

CoreRecipes

**Declared In**

`NSGraphics.h`

**NSOpenGLGetOption**

Returns global OpenGL options.

```
void NSOpenGLGetOption (
 NSOpenGLGlobalOption pname,
 GLint *param
);
```

**Discussion**

Returns in *param* the value of the global OpenGL parameter *pname*. The available options are enumerated by the `NSOpenGLGlobalOption` (page 3707) type.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**  
NSOpenGL.h

## NSOpenGLGetVersion

Returns the NSOpenGL version numbers.

```
void NSOpenGLGetVersion (
 GLint *major,
 GLint *minor
);
```

### Discussion

Returns by reference the major and minor version numbers of the NSOpenGL implementation. This function is not the same as the OpenGL version.

### Availability

Available in Mac OS X v10.0 and later.

**Declared In**  
NSOpenGL.h

## NSOpenGLSetOption

Sets global OpenGL options.

```
void NSOpenGLSetOption (
 NSOpenGLGlobalOption pname,
 GLint param
);
```

### Discussion

Sets the value of the global OpenGL parameter *pname* to *param*. The available options are enumerated by the [NSOpenGLGlobalOption](#) (page 3707) type.

### Availability

Available in Mac OS X v10.0 and later.

**Declared In**  
NSOpenGL.h

## NSPerformService

Programmatically invokes a Services menu service.

```

BOOL NSPerformService (
 NSString *itemName,
 NSPasteboard *pboard
);

```

**Parameters***itemName*

Specifies a Services menu item, in any language. If the requested service is from a submenu of the Services menu, the value must contain a slash (for example, “Mail/Selection”).

*pboard*

The pasteboard containing the data required by the service. This data must be present for the service to succeed. On output, this pasteboard contains the data returned by the service provider.

**Return Value**

YES if the service was successfully performed or NO if it was not.

**Discussion**

Use this function to programmatically invoke a service found in the application’s Services menu.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSApplication.h

**NSPlanarFromDepth**

Returns whether the specified window depth is planar.

```

BOOL NSPlanarFromDepth (
 NSWindowDepth depth
);

```

**Discussion**

Returns YES if the specified window *depth* is planar and NO if it is not.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSGraphics.h

**NSReadPixel**

Reads the color of the pixel at the specified location.

```

NSColor * NSReadPixel (
 NSPoint passedPoint
);

```

**Parameters***passedPoint*

The pixel location to read, specified in the current coordinate system.

**Return Value**

The color of the pixel at the specified location.

**Discussion**

Because the *passedPoint* parameter is relative to the current coordinate system, if you wish to read a pixel from a specific view, you must convert points in the view's coordinate system to the current coordinate system before calling this function. Alternatively, you can lock focus on the view and then specify the pixel coordinate in the view's coordinate system.

When mapping the specified point to pixel boundaries, this method rounds to the nearest pixel. For more information on how coordinate points map to the underlying pixels, see *Coordinate Systems and Transforms* in *Cocoa Drawing Guide*.

**Availability**

Available in Mac OS X v10.0 and later.

**Related Sample Code**

Color Sampler

Monochrome Image

**Declared In**

NSGraphics.h

**NSRectClip**

Modifies the current clipping path by intersecting it with the passed rect.

```
void NSRectClip (
 NSRect aRect
);
```

**Parameters**

*aRect*

The rectangle to intersect with the current clipping rectangle.

**Discussion**

This function modifies the clipping path permanently. If you need to undo this modification later, you should save the current graphics state before calling this function and restore it once you are done.

A side effect of this function is that it clears the current Quartz 2D drawing path information. If you used Quartz 2D functions to create a drawing path in the current context, and you want to save that path information and use it later, you should transfer it to a *CGPathRef* opaque type before calling this function. If you are using only Cocoa to do your drawing, this behavior should not affect you.

**Availability**

Available in Mac OS X v10.0 and later.

**Related Sample Code**

Aperture Edit Plugin - Borders & Titles

**Declared In**

NSGraphics.h

## NSRectClipList

Modifies the current clipping path by intersecting it with the passed rect.

```
void NSRectClipList (
 const NSRect *rects,
 NSInteger count
);
```

### Parameters

*rects*

A pointer to an array of `NSRect` structures, which are combined and intersected with the current clipping path.

*count*

The number of rectangles in *rects*.

### Discussion

This function modifies the clipping path permanently by generating a graphical union of the specified rectangles and then intersecting that union with the current clipping path. If you need to undo this modification later, you should save the current graphics state before calling this function and restore it once you are done.

A side effect of this function is that it clears the current Quartz 2D drawing path information. If you used Quartz 2D functions to create a drawing path in the current context, and you want to save that path information and use it later, you should transfer it to a `CGPathRef` opaque type before calling this function. If you are using only Cocoa to do your drawing, this behavior should not affect you.

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

`NSGraphics.h`

## NSRectFill

Fills the passed rectangle with the current color.

```
void NSRectFill (
 NSRect aRect
);
```

### Parameters

*aRect*

The bounding rectangle (in the current coordinate system) in which to draw.

### Discussion

Fills *aRect* with the current color using the compositing mode [NSCompositeCopy](#) (page 1349), which fills with the current color by copying the RGBA values. Use [NSRectFillUsingOperation](#) (page 3692) to fill specifying a compositing mode.

For a list of compositing operations and how you use them, see *Cocoa Drawing Guide*.

### Availability

Available in Mac OS X v10.0 and later.

**Related Sample Code**

Dicey

FilterDemo

Quartz Composer WWDC 2005 TextEdit

Sketch-112

TextEditPlus

**Declared In**

NSGraphics.h

**NSRectFillList**

Fills the rectangles in the passed list with the current fill color.

```
void NSRectFillList (
 const NSRect *rects,
 NSInteger count
);
```

**Parameters***rects*

A pointer to an array of `NSRect` structures representing the rectangles to fill.

*count*

The number of rectangles in *rects*.

**Discussion**

Fills the specified rectangles with the current fill color using the compositing mode `NSCompositeCopy`.

For a list of compositing operations and how you use them, see *Cocoa Drawing Guide*.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSGraphics.h

**NSRectFillListUsingOperation**

Fills the rectangles in a list using the current fill color and specified compositing operation.

```
void NSRectFillListUsingOperation (
 const NSRect *rects,
 NSInteger count,
 NSCompositingOperation op
);
```

**Parameters***rects*

A pointer to an array of `NSRect` structures representing the rectangles to fill.

*count*

The number of rectangles in the *rects* parameter.

*op*

The compositing operation to use when filling the rectangles.

**Discussion**

Fills a list of *count* rectangles with the current fill color, using the compositing operation *op*. For example, specifying [NSCompositeSourceOver](#) (page 1349) will blend with what's already been drawn.

For a list of compositing operations and how you use them, see *Cocoa Drawing Guide*.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSGraphics.h

**NSRectFillListWithColors**

Fills the rectangles in the passed list with the passed list of colors.

```
void NSRectFillListWithColors (
 const NSRect *rects,
 NSColor **colors,
 NSInteger num
);
```

**Parameters***rects*

A pointer to an array of `NSRect` structures representing the rectangles to fill.

*colors*

A pointer to an array of `NSColor` objects. The number of color objects in this parameter must equal the number of rectangles in the *rects* parameter.

*num*

The number of rectangles in the *rects* parameter.

**Discussion**

Takes a list of *num* rectangles and a matching list of color objects. The first rectangle is filled with the first color, the second rectangle with the second color, and so on. There must be an equal number of rectangles and color values. The rectangles are composited using the [NSCompositeCopy](#) (page 1349) operator and the order in which the rectangles are filled cannot be guaranteed; therefore, overlapping rectangles may not draw as expected. This function alters the current color of the current graphics state, setting it unpredictably to one of the values passed in *colors*.

For a list of compositing operations and how you use them, see *Cocoa Drawing Guide*.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSGraphics.h

**NSRectFillListWithColorsUsingOperation**

Fills the rectangles in a list using the specified colors and compositing operation.

```
void NSRectFillListWithColorsUsingOperation (
 const NSRect *rects,
 NSColor **colors,
 NSInteger num,
 NSCompositingOperation op
);
```

**Parameters***rects*

A pointer to an array of `NSRect` structures representing the rectangles to fill.

*colors*

A pointer to an array of `NSColor` objects. The number of color objects in this parameter must equal the number of rectangles in the *rects* parameter.

*num*

The number of rectangles in the *rects* parameter.

*op*

The compositing operation to use when filling the rectangles.

**Discussion**

Takes a list of *num* rectangles and a matching list of color values. The first rectangle is filled with the first color, the second rectangle with the second color, and so on. There must be an equal number of rectangles and color values. Each fill operation is performed using the compositing operation *op*. The rectangles should not overlap; the order in which they are filled cannot be guaranteed. This function alters the current color of the current graphics state, setting it unpredictably to one of the values passed in *colors*.

For a list of compositing operations and how you use them, see *Cocoa Drawing Guide*.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSGraphics.h`

**NSRectFillListWithGrays**

Fills the rectangles in the passed list with the passed list of grays.

```
void NSRectFillListWithGrays (
 const NSRect *rects,
 const CGFloat *grays,
 NSInteger num
);
```

**Parameters***rects*

A pointer to an array of `NSRect` structures representing the rectangles to fill.

*grays*

A pointer to an array of floating-point values in the range 0.0 to 1.0, where 0.0 represents absolute black and 1.0 represents absolute white and numbers in between are varying levels of gray. Values outside this range are clamped to 0.0 or 1.0.

*num*

The number of rectangles in the *rects* parameter.

**Discussion**

Takes a list of *num* rectangles and a matching list of gray values. The first rectangle is filled with the first gray, the second rectangle with the second gray, and so on. There must be an equal number of rectangles and gray values. The rectangles are composited using the [NSCompositeCopy](#) (page 1349) operator and the order in which the rectangles are filled cannot be guaranteed; therefore, overlapping rectangles may not draw as expected. This function alters the current color of the current graphics state, setting it unpredictably to one of the values passed in *grays*.

For a list of compositing operations and how you use them, see *Cocoa Drawing Guide*.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSGraphics.h

**NSRectFillUsingOperation**

Fills a rectangle using the current fill color and the specified compositing operation.

```
void NSRectFillUsingOperation (
 NSRect aRect,
 NSCompositingOperation op
);
```

**Parameters**

*aRect*

The rectangle to fill with the current fill color.

*op*

The compositing operation to use when filling the rectangle.

**Discussion**

For a list of compositing operations and how you use them, see *Cocoa Drawing Guide*.

**Availability**

Available in Mac OS X v10.0 and later.

**Related Sample Code**

Cropped Image

RGB Image

RGB ValueTransformers

Tinted Image

**Declared In**

NSGraphics.h

**NSRegisterServiceProvider**

Registers a service provider.

```
void NSRegisterServiceProvider (
 id provider,
 NSString *name
);
```

**Parameters***provider*

The object providing the service you want to register.

*name*

The unique name to associate with the service. This string is used to advertise the service to interested clients.

**Discussion**

Use this function to register custom services not directly related to your application.

You should not use this function to register the services provided by your application. For your application's services, you should use the [setServicesProvider:](#) (page 170) method of `NSApplication`, passing a non-nil argument.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSApplication.h`

**NSReleaseAlertPanel**

Releases an alert panel.

```
void NSReleaseAlertPanel (
 id panel
);
```

**Discussion**

When you're finished with a panel created by a function such as [NSGetAlertPanel](#) (page 3679), [NSGetCriticalAlertPanel](#) (page 3680), or [NSGetInformationalAlertPanel](#) (page 3681), you must free it by passing it to this function.

Note that the alert panel may not be deallocated immediately because it may have internal references that are released in a deferred way. You should not make the assumption that the alert panel is immediately removed from the application window list.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSPanel.h`

**NSRunAlertPanel**

Creates an alert panel.

```

NSInteger NSRunAlertPanel (
 NSString *title,
 NSString *msg,
 NSString *defaultButton,
 NSString *alternateButton,
 NSString *otherButton,
 ...
);

```

**Discussion**

Creates and runs an alert panel (or dialog) with the title of *title*, the text of *msg*, and buttons with titles of *defaultButton*, *alternateButton*, and *otherButton*. See the description of [NSBeginAlertSheet](#) (page 3658) for information on layout of buttons, default parameters, and possible return values. `NSRunAlertPanel` runs the panel in a modal event loop.

A Command-D key equivalent for the “Don’t Save” button is provided, if one is found. The button titles are searched for the localized value for “Don’t Save.” If a match is found, that button is assigned a Command-D key equivalent, provided it is not the default button.

If you create a modal panel using [runModalForWindow:](#) (page 164) or [beginSheet:modalForWindow:modalDelegate:didEndSelector:contextInfo:](#) (page 144), you can assign the key equivalent yourself, using [setKeyEquivalent:](#) (page 487) and [setKeyEquivalentModifierMask:](#) (page 488).

This function not only creates the panel; it also puts the panel onscreen and runs it using the [runModalForWindow:](#) (page 164) method defined in the `NSApplication` class. This method sets up a modal event loop that causes the panel to remain onscreen until the user clicks one of its buttons. This function then removes the panel from the screen list and returns a value that indicates which of the three buttons the user clicked. For efficiency, this function creates the panel the first time it’s called and reuses it on subsequent calls, reconfiguring it if necessary.

**Availability**

Available in Mac OS X v10.0 and later.

**Related Sample Code**

CocoaSpeechSynthesisExample  
 Quartz Composer WWDC 2005 TextEdit  
 SimpleCocoaApp  
 TextEditPlus  
 WhackedTV

**Declared In**

`NSPanel.h`

**NSRunCriticalAlertPanel**

Creates and runs a critical alert panel.

```
NSInteger NSRunCriticalAlertPanel (
 NSString *title,
 NSString *msg,
 NSString *defaultButton,
 NSString *alternateButton,
 NSString *otherButton,
 ...
);
```

**Discussion**

Creates a critical alert panel that warns the user of some critical consequence of a requested action; the panel lets the user cancel the action and may allow the user to modify the action. It then runs the panel in a modal event loop.

The panel presented to the user is badged with a caution icon. Critical alerts should be used only as specified in the "Alerts" section of the Windows chapter of *Apple Human Interface Guidelines*.

The arguments for this function are the same as those for [NSRunAlertPanel](#) (page 3693).

**Availability**

Available in Mac OS X v10.0 and later.

**Related Sample Code**

CIAnnotation

NewsReader

SimplePlayThru

**Declared In**

NSPanel.h

**NSRunInformationalAlertPanel**

Creates and runs an informational alert panel.

```
NSInteger NSRunInformationalAlertPanel (
 NSString *title,
 NSString *msg,
 NSString *defaultButton,
 NSString *alternateButton,
 NSString *otherButton,
 ...
);
```

**Discussion**

Creates an informational alert panel that provides information related to a requested action. It then runs the panel in a modal event loop.

The arguments for this function are the same as those for [NSRunAlertPanel](#) (page 3693).

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSPanel.h

## NSSetFocusRingStyle

Specifies how a focus ring will be drawn.

```
void NSSetFocusRingStyle (
 NSFocusRingPlacement placement
);
```

### Parameters

*placement*

Specifies how you want the focus ring to be drawn.

### Discussion

Use `NSFocusRingAbove` to draw the focus ring over an image, use `NSFocusRingBelow` to draw the focus ring under text, and use `NSFocusRingOnly` if you don't have an image or text. For the `NSFocusRingOnly` case, fills a shape to add the focus ring around the shape.

Note that the focus ring may actually be drawn outside the view but will be clipped to any clipping superview or the window content view.

### Availability

Available in Mac OS X v10.1 and later.

### Related Sample Code

Clock Control

Dicey

TrackBall

### Declared In

`NSGraphics.h`

## NSSetShowsServicesMenuItem

Specifies whether an item should be included in Services menus.

```
NSInteger NSSetShowsServicesMenuItem (
 NSString *itemName,
 BOOL enabled
);
```

### Discussion

Deprecated. This function simply returns 0.

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

`NSApplication.h`

## NSShowAnimationEffect

Runs a system animation effect.

```
void NSShowAnimationEffect (
 NSAnimationEffect animationEffect,
 NSPoint centerLocation,
 NSSize size,
 id animationDelegate,
 SEL didEndSelector,
 void *contextInfo
);
```

**Parameters***animationEffect*

The type of animation you want to apply.

*centerLocation*

The location at which to show the animated image, specified in screen coordinates. The animation is centered on the point you specify.

*size*

The desired size of the animated image. Specify `NSZeroSize` to perform the animation at the default size.

*animationDelegate*

The object to notify when the animation completes. Specify `nil` if you do not need to be notified when the animation completes.

*didEndSelector*

The selector of *animationDelegate* to call when the animation completes. Specify `nil` if you do not need to be notified when the animation completes. If you specify a selector, the corresponding method should have the following signature:

```
- (void)animationEffectDidEnd:(void *)contextInfo;
```

*contextInfo*

A pointer to any optional information you want passed as a parameter to the selector in the *didEndSelector* parameter.

**Discussion**

This function runs one of the standard system animation effects, which includes display and sound. For example, you can use this function to display the puff of smoke effect. For a complete list of animation effects, see [NSAnimationEffect](#) (page 3703).

**Availability**

Available in Mac OS X v10.3 and later.

**Declared In**

`NSGraphics.h`

**NSShowsServicesMenuItem**

Specifies whether a Services menu item is currently enabled.

```
BOOL NSShowsServicesMenuItem (
 NSString *itemName
);
```

**Discussion**

Deprecated. This function simply returns YES.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSApplication.h

**NSUnregisterServiceProvider**

Unregisters a service provider.

```
void NSUnregisterServiceProvider(NSString *name);
```

**Parameters**

*name*

The name of the service you want to unregister.

**Discussion**

Use this function to unregister custom services not directly related to your application.

You should not use this function to unregister the services provided by your application. For your application's services, you should use the [setServiceProvider:](#) (page 170) method of `NSApplication`, passing a `nil` argument.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSApplication.h

**NSUpdateDynamicServices**

Causes the services information for the system to be updated.

```
void NSUpdateDynamicServices (void);
```

**Discussion**

Used by a service-providing application to reregister the services it is willing to provide. To do this, you create a bundle with the extension `".service"` and place it in the application's path or `~/Library/Services`. The content of the bundle is identical to a normal service bundle. You then call this function.

It is only necessary to call this function if your program adds dynamic services to the system.

**Availability**

Available in Mac OS X v10.0 and later.

**Related Sample Code**

SpotlightFortunes

**Declared In**

NSApplication.h

## NSWindowList

Gets information about onscreen windows.

```
void NSWindowList (
 NSInteger size,
 NSInteger list[]
);
```

### Discussion

Provides an ordered list of all onscreen windows. It fills *list* with up to *size* window numbers; the order of windows in the array is the same as their order in the window server's screen list (their front-to-back order on the screen). Use the count obtained by [NSCountWindows](#) (page 3663) to specify the size of the array for this function.

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

NSGraphics.h

## NSWindowListForContext

Gets information about an application's onscreen windows.

```
void NSWindowListForContext (
 NSInteger context,
 NSInteger size,
 NSInteger list[]
);
```

### Discussion

Provides an ordered list of onscreen windows for a particular application, identified by *context*, which is a window server connection ID. It fills *list* with up to *size* window numbers; the order of windows in the array is the same as their order in the window server's screen list (their front-to-back order on the screen). Use the count obtained by the [NSCountWindowsForContext](#) (page 3664) function to specify the size of the array for this function.

Use of this function is discouraged as it may be deprecated in a future release.

### Availability

Available in Mac OS X v10.0 and later.

### Declared In

NSGraphics.h

# Data Types

---

# Application Kit Data Types Reference

---

**Framework:** AppKit/AppKit.h

## Overview

This document describes the data types defined in the Application Kit framework and not described in a document for an individual class.

## Data Types

### NSAnimationEffect

This type defines the standard system animation effects, which include both display and sound.

```
typedef enum _NSAnimationEffect {
 NSAnimationEffectDisappearingItemDefault = 0,
 NSAnimationEffectPoof = 10
} NSAnimationEffect;
```

#### Constants

`NSAnimationEffectDisappearingItemDefault`

The default effect.

Available in Mac OS X v10.3 and later.

Declared in `NSGraphics.h`.

`NSAnimationEffectPoof`

An effect showing a puff of smoke.

Available in Mac OS X v10.3 and later.

Declared in `NSGraphics.h`.

#### Discussion

These effects are used to indicate that an item was removed from a collection, such as a toolbar, without deleting the underlying data. See [NSShowAnimationEffect](#) (page 3696).

#### Availability

Available in Mac OS X v10.3 and later.

#### Declared In

`NSGraphics.h`

**NSBrowserAuxiliaryOpaque**

A private data structure used internally by `NSBrowser`.

```
typedef struct NSBrowserAuxiliary NSBrowserAuxiliaryOpaque;
```

**Availability**

Available in Mac OS X v10.3 and later.

**Declared In**

`NSBrowser.h`

**NSColorListAuxiliaryOpaque**

A private data structure used internally by `NSColorList`.

```
typedef struct NSColorListAuxiliary NSColorListAuxiliaryOpaque;
```

**Availability**

Available in Mac OS X v10.3 and later.

**Declared In**

`NSColorList.h`

**NSFocusRingPlacement**

The focus ring style indicates how the focus ring will be drawn.

```
typedef enum {
 NSFocusRingOnly = 0,
 NSFocusRingBelow = 1,
 NSFocusRingAbove = 2
} NSFocusRingPlacement;
```

**Constants**

`NSFocusRingAbove`

Use `NSFocusRingAbove` to draw over an image.

Fill a shape to add the focus ring around the shape.

Available in Mac OS X v10.1 and later.

Declared in `NSGraphics.h`.

`NSFocusRingBelow`

Use `NSFocusRingBelow` to draw the focus ring under text.

Available in Mac OS X v10.1 and later.

Declared in `NSGraphics.h`.

`NSFocusRingOnly`

Use `NSFocusRingOnly` if you don't have an image or text.

Available in Mac OS X v10.1 and later.

Declared in `NSGraphics.h`.

**Availability**

Available in Mac OS X v10.1 and later.

**Declared In**

NSGraphics.h

**NSFocusRingType**

The focus ring type is used by `NSView` and `NSCell` to configure if and how a control should draw its focus ring.

```
typedef enum _NSFocusRingType {
 NSFocusRingTypeDefault = 0,
 NSFocusRingTypeNone = 1,
 NSFocusRingTypeExterior = 2
} NSFocusRingType;
```

**Constants**`NSFocusRingTypeDefault`

The default focus ring type for `NSView` or `NSCell`.

Available in Mac OS X v10.3 and later.

Declared in `NSGraphics.h`.

`NSFocusRingTypeNone`

No focus ring. If you set the focus ring type to this value, `NSView` and `NSCell` will not draw any focus ring.

Available in Mac OS X v10.3 and later.

Declared in `NSGraphics.h`.

`NSFocusRingTypeExterior`

The standard Aqua focus ring.

Available in Mac OS X v10.3 and later.

Declared in `NSGraphics.h`.

**Availability**

Available in Mac OS X v10.3 and later.

**Declared In**

NSGraphics.h

**NSInterfaceStyle**

These constants are used in `NSResponder`'s [interfaceStyle](#) (page 2131) method.

```
typedef enum {
 NSNoInterfaceStyle = 0,
 NSNextStepInterfaceStyle = 1,
 NSWindows95InterfaceStyle = 2,
 NSMacintoshInterfaceStyle = 3
} NSInterfaceStyle;
```

**Constants****NSNoInterfaceStyle**

The default interface style.

Available in Mac OS X v10.0 and later.

Declared in `NSInterfaceStyle.h`.**NSNextStepInterfaceStyle**

The NextStep interface style.

Available in Mac OS X v10.0 and later.

Declared in `NSInterfaceStyle.h`.**NSWindows95InterfaceStyle**

The Windows 95 interface style.

Available in Mac OS X v10.0 and later.

Declared in `NSInterfaceStyle.h`.**NSMacintoshInterfaceStyle**

The Macintosh interface style.

Available in Mac OS X v10.0 and later.

Declared in `NSInterfaceStyle.h`.**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**`NSInterfaceStyle.h`**NSModalSession**

Variables of type `NSModalSession` point to information used by the system between `NSApplication`'s [beginModalSessionForWindow:](#) (page 143) and [endModalSession:](#) (page 149) messages.

```
typedef struct _NSModalSession *NSModalSession;
```

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**`NSApplication.h`**NSOpenGLContextAuxiliary**A private data structure used by `NSOpenGLContext`.

```
typedef struct _CGLContextObject NSOpenGLContextAuxiliary;
```

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSOpenGL.h

**NSOpenGLGlobalOption**

These constants are option names for [NSOpenGLSetOption](#) (page 3685) and [NSOpenGLGetOption](#) (page 3684).

```
typedef enum {
 NSOpenGLGLOFormatCacheSize = 501,
 NSOpenGLGLOClearFormatCache = 502,
 NSOpenGLGLORetainRenderers = 503,
 NSOpenGLGLOResetLibrary = 504
} NSOpenGLGlobalOption;
```

**Constants**

NSOpenGLGLOFormatCacheSize

Sets the size of the pixel format cache.

Available in Mac OS X v10.0 and later.

Declared in NSOpenGL.h.

NSOpenGLGLOClearFormatCache

Resets the pixel format cache if true.

Available in Mac OS X v10.0 and later.

Declared in NSOpenGL.h.

NSOpenGLGLORetainRenderers

Whether to retain loaded renderers in memory.

Available in Mac OS X v10.0 and later.

Declared in NSOpenGL.h.

NSOpenGLGLOResetLibrary

Does a soft reset of the CGL library if true.

Available in Mac OS X v10.0 and later.

Declared in NSOpenGL.h.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSOpenGL.h

**NSOpenGLPixelFormatAuxiliary**

A private data structure used by NSOpenGLPixelFormat.

```
typedef struct _CGLPixelFormatObject NSOpenGLPixelFormatAuxiliary;
```

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSOpenGL.h

**NSSavePanelAuxiliaryOpaque**

A private data structure used internally by NSSavePanel.

```
typedef struct NSSavePanelAuxiliary NSSavePanelAuxiliaryOpaque;
```

**Availability**

Available in Mac OS X v10.3 and later.

**Declared In**

NSSavePanel.h

**NSScreenAuxiliaryOpaque**

A private data structure used internally by NSScreen.

```
typedef struct NSScreenAuxiliary NSScreenAuxiliaryOpaque;
```

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

NSScreen.h

**NSTabViewItemAuxiliaryOpaque**

A private data structure used by NSTabViewItem.

```
typedef struct NSTabViewItemAuxiliary NSTabViewItemAuxiliaryOpaque;
```

**Availability**

Available in Mac OS X v10.2 and later.

**Declared In**

NSTabViewItem.h

**NSTypesetterGlyphInfo**

This type is a caching structure used by NSSimpleHorizontalTypesetter.

```
typedef struct _NSTypesetterGlyphInfo {
 NSPoint curLocation;
 float extent;
 float belowBaseline;
 float aboveBaseline;
 unsigned glyphCharacterIndex;
 NSFont *font;
 NSSize attachmentSize;
 struct {
 BOOL defaultPositioning:1;
 BOOL dontShow:1;
 BOOL isAttachment:1;
 } _giflags;
} NSTypesetterGlyphInfo;
```

**Fields**`curLocation`

Location (relative to the baseline) for laying this glyph out.

`extent`

Required space from `curLocation` to lay this glyph out; –1.0 if not set.

`belowBaseline`

Distance from baseline to bottom of the line fragment required for all the glyphs so far, including this one (positive if baseline is above the bottom of the line fragment).

`aboveBaseline`

Distance from baseline to top of the line fragment required for all the glyphs so far, including this one (positive if baseline is below the top of the line fragment).

`glyphCharacterIndex`

Character index.

`font`

Font.

`attachmentSize`

Size of the character if it's an attachment; otherwise meaningless.

`defaultPositioning`

This block needs to be “show”ed.

`dontShow`

Don't show this glyph.

`isAttachment`

Whether the glyph is an attachment.

**Availability**

Available in Mac OS X v10.0 and later.

**Declared In**

`NSSimpleHorizontalTypesetter.h`

# Constants

---

# Application Kit Constants Reference

---

**Framework:** AppKit/AppKit.h

## Overview

This document describes the constants defined in the Application Kit framework that are not defined in, or are not described in, a document for an individual class.

See *Application Kit Data Types Reference* for descriptions of other constants defined in enumerations.

## Constants

There are three types of constant in this document: global variables, errors, and exceptions.

## Global Variables

---

### Color Space Names

Color-space names designate predefined color spaces.

```
NSString *NSCalibratedWhiteColorSpace;
NSString *NSCalibratedBlackColorSpace;
NSString *NSCalibratedRGBColorSpace;
NSString *NSDeviceWhiteColorSpace;
NSString *NSDeviceBlackColorSpace;
NSString *NSDeviceRGBColorSpace;
NSString *NSDeviceCMYKColorSpace;
NSString *NSNamedColorSpace;
NSString *NSPatternColorSpace;
NSString *NSCustomColorSpace;
```

#### Constants

`NSCalibratedWhiteColorSpace`

Calibrated color space with white and alpha components (pure white is 1.0)

Available in Mac OS X v10.0 and later.

Declared in `NSGraphics.h`.

**NSCalibratedBlackColorSpace**

Calibrated color space with black and alpha components (pure black is 1.0)

Available in Mac OS X v10.0 and later.

Declared in `NSGraphics.h`.

**NSCalibratedRGBColorSpace**

Calibrated color space with red, green, blue, and alpha components.

You can also create a color with HSB (hue, saturation, brightness) and alpha components and can extract these components.

Available in Mac OS X v10.0 and later.

Declared in `NSGraphics.h`.

**NSDeviceWhiteColorSpace**

Device-dependent color space with white and alpha components (pure white is 1.0)

Available in Mac OS X v10.0 and later.

Declared in `NSGraphics.h`.

**NSDeviceBlackColorSpace**

Device-dependent color space with black and alpha components (pure black is 1.0)

Available in Mac OS X v10.0 and later.

Declared in `NSGraphics.h`.

**NSDeviceRGBColorSpace**

Device-dependent color space with red, green, blue, and alpha components.

You can also create a color with HSB (hue, saturation, brightness) and alpha components and can extract these components.

Available in Mac OS X v10.0 and later.

Declared in `NSGraphics.h`.

**NSDeviceCMYKColorSpace**

Device-dependent color space with cyan, magenta, yellow, black, and alpha components

Available in Mac OS X v10.0 and later.

Declared in `NSGraphics.h`.

**NSNamedColorSpace**

Catalog name and color name components

The components of this color space are indexes into lists or catalogs of prepared colors. The catalogs of named colors come with lookup tables that are able to generate the correct color on a given device.

Available in Mac OS X v10.0 and later.

Declared in `NSGraphics.h`.

**NSPatternColorSpace**

Pattern image (tiled)

Identifies a pattern color space, which is simply an image that is repeated over and over again in a tiled pattern.

Available in Mac OS X v10.0 and later.

Declared in `NSGraphics.h`.

`NSCustomColorSpace`

Custom `NSColorSpace` object and floating-point components describing a color in that space

A custom color-space object represents a color space that is not necessarily predefined by the Application Kit. See “Working With Color Spaces” for information on creating custom color-space objects.

Available in Mac OS X v10.0 and later.

Declared in `NSGraphics.h`.

### Discussion

You can use a color-space name in certain methods of `NSColor` that create or convert color objects. The name identifies the color space to be used for the operation.

### Declared In

`NSGraphics.h`

## Grayscale Values

These constants are the standard gray values for the 2-bit deep grayscale color space.

```
const float NSWhite;
const float NSLightGray;
const float NSDarkGray;
const float NSBlack;
```

### Constants

`NSWhite`

A constant that specifies the white shade in the 2-bit deep grayscale color space.

Available in Mac OS X v10.0 and later.

Declared in `NSGraphics.h`.

`NSLightGray`

A constant that specifies the light gray shade in the 2-bit deep grayscale color space.

Available in Mac OS X v10.0 and later.

Declared in `NSGraphics.h`.

`NSDarkGray`

A constant that specifies the dark gray shade in the 2-bit deep grayscale color space.

Available in Mac OS X v10.0 and later.

Declared in `NSGraphics.h`.

`NSBlack`

A constant that specifies the black shade in the 2-bit deep grayscale color space.

Available in Mac OS X v10.0 and later.

Declared in `NSGraphics.h`.

### Declared In

`NSGraphics.h`

## NSInterfaceStyleDefault

`NSInterfaceStyleDefault` can be used to override the platform’s default interface style.

```
NSString *NSInterfaceStyleDefault;
```

**Discussion**

For more information, see the function [NSInterfaceStyleForKey](#) (page 3683).

**Interface Builder Constants**

Type qualifiers used by Interface Builder to synchronize with Xcode. For more information, see *Communicating With Objects* in *Cocoa Fundamentals Guide*.

```
#define IBAction void
#define IBOutlet
```

**Constants**

`IBAction`

Type qualifier used by Interface Builder to synchronize actions added programmatically with its internal list of action methods defined for a project.

Available in Mac OS X v10.0 and later.

Declared in `NSNibDeclarations.h`.

`IBOutlet`

Identifier used to qualify an instance-variable declaration so that Interface Builder can synchronize the display and connection of outlets with Xcode.

Available in Mac OS X v10.0 and later.

Declared in `AMBundleAction.h`.

**Declared In**

`NSNibDeclarations.h`

**NSWindow—Sizes**

Obsolete constant values. Do not use.

```
NSSize NSIconSize;
NSSize NSTokenSize;
```

**Errors**

---

**Attributed String Errors**

These constants represent errors generated by `NSAttributedString`.

```
enum {
 NSTextReadInapplicableDocumentTypeError = 65806,
 NSTextWriteInapplicableDocumentTypeError = 66062,
 NSTextReadWriteErrorMinimum = 65792,
 NSTextReadWriteErrorMaximum = 66303
};
```

**Constants**

`NSTextReadInapplicableDocumentTypeError`

Indicates a problem reading data with the specified format.

Available in Mac OS X v10.4 and later.

Declared in `AppKitErrors.h`.

`NSTextWriteInapplicableDocumentTypeError`

Indicates a problem writing data of the specified format.

Available in Mac OS X v10.4 and later.

Declared in `AppKitErrors.h`.

`NSTextReadWriteErrorMinimum`

The beginning of a range of error codes reserved for future use.

Available in Mac OS X v10.4 and later.

Declared in `AppKitErrors.h`.

`NSTextReadWriteErrorMaximum`

The end of a range of error codes reserved for future use.

Available in Mac OS X v10.4 and later.

Declared in `AppKitErrors.h`.

**Discussion**

These constants are returned in an `NSError` object.

**Declared In**

`AppKitErrors.h`

## Exceptions

---

### Application Kit Exception Names

These constants name the exceptions that the Application Kit can raise.

```

NSString *NSTextLineTooLongException;
NSString *NSTextNoSelectionException;
NSString *NSWordTablesWriteException;
NSString *NSWordTablesReadException;
NSString *NSTextReadException;
NSString *NSTextWriteException;
NSString *NSPasteboardCommunicationException;
NSString *NSPrintingCommunicationException;
NSString *NSAbortModalException;
NSString *NSAbortPrintingException;
NSString *NSIllegalSelectorException;
NSString *NSAppKitVirtualMemoryException;
NSString *NSBadRTFDirectiveException;
NSString *NSBadRTFFontTableException;
NSString *NSBadRTFStyleSheetException;
NSString *NSTypedStreamVersionException;
NSString *NSTIFFException;
NSString *NSPrintPackageException;
NSString *NSBadRTFColorTableException;
NSString *NSDraggingException;
NSString *NSColorListIOException;
NSString *NSColorListNotEditableException;
NSString *NSBadBitmapParametersException;
NSString *NSWindowServerCommunicationException;
NSString *NSFontUnavailableException;
NSString *NSPPDIncludeNotFoundException;
NSString *NSPPDParseException;
NSString *NSPPDIncludeStackOverflowException;
NSString *NSPPDIncludeStackUnderflowException;
NSString *NSRTFPropertyStackOverflowException;
NSString *NSAppKitIgnoredException;
NSString *NSBadComparisonException;
NSString *NSImageCacheException;
NSString *NSNibLoadingException;
NSString *NSBrowserIllegalDelegateException;
NSString *NSAccessibilityException;

```

**Constants**

`NSTextLineTooLongException`

Exception generated if a line is too long in a `NSText` object.

Available in Mac OS X v10.0 and later.

Declared in `NSErrors.h`.

`NSTextNoSelectionException`

Available in Mac OS X v10.0 and later.

Declared in `NSErrors.h`.

`NSWordTablesWriteException`

Available in Mac OS X v10.0 and later.

Declared in `NSErrors.h`.

`NSWordTablesReadException`

Available in Mac OS X v10.0 and later.

Declared in `NSErrors.h`.

`NSTextReadException`

**Available in Mac OS X v10.0 and later.**

**Declared in `NSErrors.h`.**

`NSTextWriteException`

**Available in Mac OS X v10.0 and later.**

**Declared in `NSErrors.h`.**

`NSPasteboardCommunicationException`

**Available in Mac OS X v10.0 and later.**

**Declared in `NSErrors.h`.**

`NSPrintingCommunicationException`

**Available in Mac OS X v10.0 and later.**

**Declared in `NSErrors.h`.**

`NSAbortModalException`

**Available in Mac OS X v10.0 and later.**

**Declared in `NSErrors.h`.**

`NSAbortPrintingException`

**Available in Mac OS X v10.0 and later.**

**Declared in `NSErrors.h`.**

`NSIllegalSelectorException`

**Available in Mac OS X v10.0 and later.**

**Declared in `NSErrors.h`.**

`NSAppKitVirtualMemoryException`

**Available in Mac OS X v10.0 and later.**

**Declared in `NSErrors.h`.**

`NSBadRTFDirectiveException`

**Available in Mac OS X v10.0 and later.**

**Declared in `NSErrors.h`.**

`NSBadRTFFontTableException`

**Available in Mac OS X v10.0 and later.**

**Declared in `NSErrors.h`.**

`NSBadRTFStyleSheetException`

**Available in Mac OS X v10.0 and later.**

**Declared in `NSErrors.h`.**

`NSTypedStreamVersionException`

**Available in Mac OS X v10.0 and later.**

**Declared in `NSErrors.h`.**

`NSTIFFException`

**Available in Mac OS X v10.0 and later.**

**Declared in `NSErrors.h`.**

`NSPrintPackageException`

**Available in Mac OS X v10.0 and later.**

**Declared in `NSErrors.h`.**

`NSBadRTFColorTableException`

**Available in Mac OS X v10.0 and later.**

**Declared in `NSErrors.h`.**

`NSDraggingException`

**Available in Mac OS X v10.0 and later.**

**Declared in `NSErrors.h`.**

`NSColorListIOException`

**Available in Mac OS X v10.0 and later.**

**Declared in `NSErrors.h`.**

`NSColorListNotEditableException`

**Available in Mac OS X v10.0 and later.**

**Declared in `NSErrors.h`.**

`NSBadBitmapParametersException`

**Available in Mac OS X v10.0 and later.**

**Declared in `NSErrors.h`.**

`NSWindowServerCommunicationException`

**Available in Mac OS X v10.0 and later.**

**Declared in `NSErrors.h`.**

`NSFontUnavailableException`

**Available in Mac OS X v10.0 and later.**

**Declared in `NSErrors.h`.**

`NSPPDIncludeNotFoundException`

**Available in Mac OS X v10.0 and later.**

**Declared in `NSErrors.h`.**

`NSPPDParseException`

**Available in Mac OS X v10.0 and later.**

**Declared in `NSErrors.h`.**

`NSPPDIncludeStackOverflowException`

**Available in Mac OS X v10.0 and later.**

**Declared in `NSErrors.h`.**

`NSPPDIncludeStackUnderflowException`

**Available in Mac OS X v10.0 and later.**

**Declared in `NSErrors.h`.**

`NSRTFPropertyStackOverflowException`

**Available in Mac OS X v10.0 and later.**

**Declared in `NSErrors.h`.**

`NSAppKitIgnoredException`

Available in Mac OS X v10.0 and later.

Declared in `NSErrors.h`.

`NSBadComparisonException`

Available in Mac OS X v10.0 and later.

Declared in `NSErrors.h`.

`NSImageCacheException`

Available in Mac OS X v10.0 and later.

Declared in `NSErrors.h`.

`NSNibLoadingException`

Available in Mac OS X v10.0 and later.

Declared in `NSErrors.h`.

`NSBrowserIllegalDelegateException`

Available in Mac OS X v10.0 and later.

Declared in `NSErrors.h`.

`NSAccessibilityException`

Available in Mac OS X v10.2 and later.

Declared in `NSErrors.h`.

**Declared In**

`NSErrors.h`

# Document Revision History

---

This table describes the changes to *Application Kit Framework Reference*.

| Date       | Notes                                                                    |
|------------|--------------------------------------------------------------------------|
| 2008-11-19 | Added NSTextInputClient Protocol Reference.                              |
| 2007-10-31 | Updated framework illustrations.                                         |
| 2007-05-10 | Added new classes introduced with Mac OS X v10.5.                        |
| 2006-05-23 | First publication of this content as a collection of separate documents. |
