NSUserInterfaceValidations Protocol Reference

Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.0 and later.
Companion guide	User Interface Validation
Declared in	NSUserInterfaceValidation.h

Overview

The `NSUserInterfaceValidations` protocol works with the `NSValidatedUserInterfaceItem` protocol to enable or disable a control automatically, depending on whether any responder in the responder chain can handle the control's action method. The `NSMenuItem` and `NSToolBarItem` classes take advantage of these protocols.

By conforming to this protocol, your custom responder can participate in this validation mechanism. To validate a control, the application calls `validateUserInterfaceItem:` for each item in the responder chain, starting with the first responder. If no responder returns `YES`, the item is disabled. For example, a menu item that sends the `copy:` action message would disable itself if no responder in the responder chain can be copied.

Tasks

Validating User Interface Items

- [validateUserInterfaceItem:](#) (page 5)
Returns whether the receiver can handle the action method for a user interface item.

Instance Methods

validateUserInterfaceItem:

Returns whether the receiver can handle the action method for a user interface item.

- (BOOL)validateUserInterfaceItem:(id < NSValidatedUserInterfaceItem >)anItem

Parameters

anItem

The user interface item to validate. You can send *anItem* the `action` and `tag` messages.

Return Value

YES if the receiver can handle the action method; NO if it cannot.

Availability

Available in Mac OS X v10.0 and later.

Declared In

NSUserInterfaceValidation.h
