NSDictionaryController Class Reference

Inherits from	NSArrayController : NSObjectController : NSController : NSObject
Conforms to	NSCoding (NSController) NSObject (NSObject)
Framework	/System/Library/Frameworks/AppKit.framework
Availability	Available in Mac OS X v10.5 and later.
Companion guide	Cocoa Bindings Programming Topics
Declared in	NSDictionaryController.h NSKeyValueBinding.h

Overview

`NSDictionaryController` is a bindings compatible class that manages display and editing of the contents of an `NSDictionary` object. `NSDictionaryController` transforms the contents of a dictionary into an array of key-value pairs that can be bound to user interface items such as the columns of an `NSTableView`.

The content of an `NSDictionaryController` instance is specified using the inherited method `setContent:` or by binding an `NSDictionary` instance to the `contentDictionary` binding. New key/value pairs inserted into the dictionary are created using the `newObject` method. The initial key name is set to the string returned by `initialKey` (page 8) (specified using `setInitialKey:` (page 11) or the `initialKey` binding). The initial value object is set to the object returned by `initialValue` (page 8) (specified using `setInitialValue:` (page 11) or the `initialValue` binding). The initial key name is copied to the newly inserted object, while the object returned by `initialValue` (page 8) is simply retained. As new items are inserted the controller enumerates the initial key name, resulting in key names such as “key”, “key1”, “key2”, and so on. This behavior can be customized by overriding `newObject` (page 10).

An `NSDictionaryController` instance can be configured to exclude specified keys in a dictionary from being returned by `arrangedObjects` (page 7) using the `setExcludedKeys:` (page 10) method or by binding an array of key names to the `excludedKeys` binding. Similarly, you can specify an array of key names that are always included in the arranged objects, even if they are not present in the content dictionary, using the `setIncludedKeys:` (page 10) method or the `includedKeys` binding.

`NSDictionaryController` supports providing localized key names for the keys in the dictionary, allowing a user-friendly representation of the key name to be displayed. The localized key names are specified by a dictionary (using `setLocalizedKeyDictionary:` (page 11) or the `localizedKeyDictionary` binding) or by providing a strings table (using `setLocalizedKeyTable:` (page 12)).

The [arrangedObjects](#) (page 7) method returns an array of objects that implement the `NSDictionaryControllerKeyValuePair` informal protocol. User interface controls are bound to the arranged objects array using key paths such as: `arrangedObjects.key` (displays the key name), `arrangedObjects.value` (displays the value for the key), or `arrangedObjects.localizedKey` (displays the localized key name). See *NSDictionaryControllerKeyValuePair Protocol Reference* for more information.

Note: You must enable the “Validates Immediately” option for the value binding of all controls that edit the key names or values returned by [arrangedObjects](#) (page 7).

Adopted Protocols

NSCoding

- `encodeWithCoder:`
- `initWithCoder:`

Tasks

Arranging Objects

- [arrangedObjects](#) (page 7)
Returns an array containing the objects that represent the receiver’s content.

Creating New Entries

- [newObject](#) (page 10)
Creates and returns a new key-value pair to represent an entry in the content dictionary.

Localizing Key Names

- [setLocalizedKeyDictionary:](#) (page 11)
Sets the localized key names that are displayed by the receiver in place of the key names.
- [localizedKeyDictionary](#) (page 9)
Returns the receiver’s localization dictionary.
- [localizedKeyTable](#) (page 9)
Returns the strings file used to localize key names.
- [setLocalizedKeyTable:](#) (page 12)
Specifies the strings file used to localize key names.

Keys to Display

- [setIncludedKeys:](#) (page 10)
Sets the key names that are represented by a key-value pair, even if they are not present in the receiver's content dictionary.
- [includedKeys](#) (page 8)
Returns an array containing the key names that are represented by a key-value pair, even if they are not present in the receiver's content dictionary.
- [setExcludedKeys:](#) (page 10)
Sets the key names that are never displayed in the user interface items bound to the receiver.
- [excludedKeys](#) (page 7)
Returns an array containing the key names that are never displayed in the user interface items bound to the receiver.

Setting Initial Key and Values

- [setInitialKey:](#) (page 11)
Sets the string used as the initial key name for a newly inserted item.
- [initialKey](#) (page 8)
Returns the string used as the initial key name for a newly inserted item.
- [setInitialValue:](#) (page 11)
Sets the string used as the initial value for a newly inserted item.
- [initialValue](#) (page 8)
Returns the string used as the initial value for a newly inserted item.

Instance Methods

arrangedObjects

Returns an array containing the objects that represent the receiver's content.

- (id)arrangedObjects

Return Value

An array of objects that implement the `NSDictionaryControllerKeyValuePair` informal protocol. See *NSDictionaryControllerKeyValuePair Protocol Reference* for more information.

excludedKeys

Returns an array containing the key names that are never displayed in the user interface items bound to the receiver.

- (NSArray *)excludedKeys

Return Value

An array containing the key names.

Availability

Available in Mac OS X v10.5 and later.

See Also

- [setExcludedKeys:](#) (page 10)

Declared In

NSDictionaryController.h

includedKeys

Returns an array containing the key names that are represented by a key-value pair, even if they are not present in the receiver's content dictionary.

- (NSArray *)includedKeys

Return Value

An array containing the key names.

Availability

Available in Mac OS X v10.5 and later.

See Also

- [setIncludedKeys:](#) (page 10)

Declared In

NSDictionaryController.h

initialKey

Returns the string used as the initial key name for a newly inserted item.

- (NSString *)initialKey

Return Value

The key name.

Availability

Available in Mac OS X v10.5 and later.

See Also

- [setInitialKey:](#) (page 11)

Declared In

NSDictionaryController.h

initialValue

Returns the string used as the initial value for a newly inserted item.

- (id)initialValue

Return Value

The value.

Availability

Available in Mac OS X v10.5 and later.

See Also

- [setInitialValue:](#) (page 11)

Declared In

NSDictionaryController.h

localizedKeyDictionary

Returns the receiver's localization dictionary.

- (NSDictionary *)localizedKeyDictionary

Return Value

A dictionary containing localized string values for the key names.

Availability

Available in Mac OS X v10.5 and later.

See Also

- [setLocalizedKeyDictionary:](#) (page 11)

Declared In

NSDictionaryController.h

localizedKeyTable

Returns the strings file used to localize key names.

- (NSString *)localizedKeyTable

Return Value

A string that specifies the string table to use when localizing key names.

Availability

Available in Mac OS X v10.5 and later.

See Also

- [setLocalizedKeyTable:](#) (page 12)

Declared In

NSDictionaryController.h

newObject

Creates and returns a new key-value pair to represent an entry in the content dictionary.

- (id)newObject

Return Value

An object that represents the key-value pair. The object must not be autoreleased, and must implement the `NSDictionaryControllerKeyValuePair` informal protocol

Discussion

This method is invoked for insertions of new key-value pairs, as well as transforming existing dictionary entries into key-value pairs for display. Objects returned by this method must implement the `NSDictionaryControllerKeyValuePair` informal protocol.

Special Considerations

Subclass implementations must ensure that the object returned by `newObject` is not autoreleased.

Availability

Available in Mac OS X v10.5 and later.

Declared In

`NSDictionaryController.h`

setExcludedKeys:

Sets the key names that are never displayed in the user interface items bound to the receiver.

- (void)setExcludedKeys:(NSArray *)keys

Parameters

keys

An array containing the key names.

Availability

Available in Mac OS X v10.5 and later.

See Also

- [excludedKeys](#) (page 7)

Declared In

`NSDictionaryController.h`

setIncludedKeys:

Sets the key names that are represented by a key-value pair, even if they are not present in the receiver's content dictionary.

- (void)setIncludedKeys:(NSArray *)keys

Parameters

keys

An array containing the key names.

Availability

Available in Mac OS X v10.5 and later.

See Also

- [includedKeys](#) (page 8)

Declared In

NSDictionaryController.h

setInitialKey:

Sets the string used as the initial key name for a newly inserted item.

```
- (void)setInitialKey:(NSString *)key
```

Parameters

key

The key name. The string is copied by the receiver.

Availability

Available in Mac OS X v10.5 and later.

See Also

- [initialKey](#) (page 8)

Declared In

NSDictionaryController.h

setInitialValue:

Sets the string used as the initial value for a newly inserted item.

```
- (void)setInitialValue:(id)value
```

Parameters

value

The initial value.

Availability

Available in Mac OS X v10.5 and later.

See Also

- [initialValue](#) (page 8)

Declared In

NSDictionaryController.h

setLocalizedKeyDictionary:

Sets the localized key names that are displayed by the receiver in place of the key names.

```
- (void)setLocalizedKeyDictionary:(NSDictionary *)dictionary
```

Parameters*dictionary*

A dictionary containing the localized key name strings.

Discussion

The dictionary contains the key names as the keys, and the localized key names as the corresponding values.

Availability

Available in Mac OS X v10.5 and later.

See Also

- [localizedKeyDictionary](#) (page 9)

Declared In

NSDictionaryController.h

setLocalizedKeyTable:

Specifies the strings file used to localize key names.

```
- (void)setLocalizedKeyTable:(NSString *)stringsFile
```

Parameters*stringsFile*

Specifies the string table to use when localizing key names.

Discussion

The string table must reside within the application's resource . See Strings Files in Introduction to Internationalization Programming Topics.

Availability

Available in Mac OS X v10.5 and later.

See Also

- [setLocalizedKeyDictionary:](#) (page 11)- [localizedKeyDictionary](#) (page 9)

Declared In

NSDictionaryController.h

Constants

Exposed Bindings

The following constants are used to specify a binding to `bind:toObject:withKeyPath:options:, infoForBinding:, unbind:, and valueClassForBinding:.` See the *Cocoa Bindings Reference* for more information.

```
NSString *NSContentDictionaryBinding;  
NSString *NSIncludedKeysBinding;  
NSString *NSExcludedKeysBinding;  
NSString *NSLocalizedKeyDictionaryBinding;  
NSString *NSInitialKeyBinding;  
NSString *NSInitialValueBinding;
```

Constants

`NSContentDictionaryBinding`

A dictionary used as the content dictionary.

Available in Mac OS X v10.5 and later.

Declared in `NSKeyValueBinding.h`.

`NSIncludedKeysBinding`

An array containing the key-value pairs always represented by the receiver.

Available in Mac OS X v10.5 and later.

Declared in `NSKeyValueBinding.h`.

`NSExcludedKeysBinding`

An array containing the key names that are never displayed in the user interface items bound to the receiver.

Available in Mac OS X v10.5 and later.

Declared in `NSKeyValueBinding.h`.

`NSLocalizedKeyDictionaryBinding`

A dictionary containing the localized key names that are displayed by the receiver in place of the key names.

Available in Mac OS X v10.5 and later.

Declared in `NSKeyValueBinding.h`.

`NSInitialKeyBinding`

A string used as the initial key name for newly inserted items.

Available in Mac OS X v10.5 and later.

Declared in `NSKeyValueBinding.h`.

`NSInitialValueBinding`

A string used as the initial value for newly inserted items.

Available in Mac OS X v10.5 and later.

Declared in `NSKeyValueBinding.h`.

Declared In

`AppKit/NSDictionaryController.h`

Document Revision History

This table describes the changes to *NSDictionaryController Class Reference*.

Date	Notes
2008-06-05	Corrected typos.
2006-07-01	New document that describes the class used with Cocoa bindings to manage a dictionary of objects.
