# CGFunction Reference

---

<b>Derived From:</b>	CType
<b>Framework:</b>	ApplicationServices/ApplicationServices.h
<b>Companion guide</b>	Quartz 2D Programming Guide
<b>Declared in</b>	CGFunction.h

## Overview

The `CGFunctionRef` opaque type provides a general facility for defining and using callback functions. These functions can take an arbitrary number of floating-point input values and pass back an arbitrary number of floating-point output values.

Quartz uses CGFunction objects to implement shadings. *CGShading Reference* describes the parameters and semantics required for the callbacks used by CGFunction objects.

## Functions by Task

### Creating a CGFunction Object

[CGFunctionCreate](#) (page 6)  
Creates a Quartz function.

### Retaining and Releasing CGFunction Objects

[CGFunctionRelease](#) (page 7)  
Decrements the retain count of a function object.

[CGFunctionRetain](#) (page 7)  
Increments the retain count of a function object.

### Getting the CType ID

[CGFunctionGetTypeID](#) (page 7)  
Returns the type identifier for Quartz function objects.

## Functions

### CGFunctionCreate

Creates a Quartz function.

```
CGFunctionRef CGFunctionCreate (
    void *info,
    size_t domainDimension,
    const CGFloat *domain,
    size_t rangeDimension,
    const CGFloat *range,
    const CGFunctionCallbacks *callbacks
);
```

#### Parameters

*info*

A pointer to user-defined storage for data that you want to pass to your callbacks. You need to make sure that the data persists for as long as it's needed, which can be beyond the scope in which the Quartz function is used.

*domainDimension*

The number of inputs.

*domain*

An array of ( $2 * \text{domainDimension}$ ) floats used to specify the valid intervals of input values. For each  $k$  from 0 to  $(\text{domainDimension} - 1)$ ,  $\text{domain}[2*k]$  must be less than or equal to  $\text{domain}[2*k+1]$ , and the  $k$ th input value will be clipped to lie in the interval  $\text{domain}[2*k] \leq \text{input}[k] \leq \text{domain}[2*k+1]$ . If this parameter is NULL, then the input values are not clipped.

*rangeDimension*

The number of outputs.

*range*

An array of ( $2 * \text{rangeDimension}$ ) floats that specifies the valid intervals of output values. For each  $k$  from 0 to  $(\text{rangeDimension} - 1)$ ,  $\text{range}[2*k]$  must be less than or equal to  $\text{range}[2*k+1]$ , and the  $k$ th output value will be clipped to lie in the interval  $\text{range}[2*k] \leq \text{output}[k] \leq \text{range}[2*k+1]$ . If this parameter is NULL, then the output values are not clipped.

*callbacks*

A pointer to a callback function table. This table should contain pointers to the callbacks you provide to implement the semantics of this Quartz function. Quartz makes a copy of your table, so, for example, you could safely pass in a pointer to a structure on the stack.

#### Return Value

The new Quartz function. You are responsible for releasing this object using [CGFunctionRelease](#) (page 7).

#### Availability

Available in Mac OS X version 10.2 and later.

#### Declared In

`CGFunction.h`

## CGFunctionGetTypeID

Returns the type identifier for Quartz function objects.

```

CTypeID CGFunctionGetTypeID (
    void
);

```

### Return Value

The identifier for the opaque type [CGFunctionRef](#) (page 9).

### Availability

Available in Mac OS X version 10.2 and later.

### Declared In

`CGFunction.h`

## CGFunctionRelease

Decrements the retain count of a function object.

```

void CGFunctionRelease (
    CGFunctionRef function
);

```

### Parameters

*function*

The function object to release.

### Discussion

This function is equivalent to `CFRelease`, except that it does not cause an error if the `function` parameter is `NULL`.

### Availability

Available in Mac OS X version 10.2 and later.

### Declared In

`CGFunction.h`

## CGFunctionRetain

Increments the retain count of a function object.

```

CGFunctionRef CGFunctionRetain (
    CGFunctionRef function
);

```

### Parameters

*function*

The same function object you passed in as the `function` parameter.

### Return Value

### Discussion

This function is equivalent to `CFRetain`, except that it does not cause an error if the `function` parameter is `NULL`.

**Availability**

Available in Mac OS X version 10.2 and later.

**Declared In**

CGFunction.h

## Callbacks

### CGFunctionEvaluateCallback

Performs custom operations on the supplied input data to produce output data.

```
typedef void (*CGFunctionEvaluateCallback) (
    void *info,
    const float *inData,
    float *outData
);
```

If you name your function `MyCGFunctionEvaluate`, you would declare it like this:

```
void MyCGFunctionEvaluate (
    void *info,
    const float *inData,
    float *outData
);
```

**Parameters**

*info*

The `info` parameter passed to [CGFunctionCreate](#) (page 6).

*inData*

An array of floats. The size of the array is that specified by the `domainDimension` parameter passed to the [CGFunctionCreate](#) (page 6) function.

*outData*

An array of floats. The size of the array is that specified by the `rangeDimension` parameter passed to the [CGFunctionCreate](#) (page 6) function.

**Discussion**

The callback you write is responsible for implementing the calculation of output values from the supplied input values. For example, if you want to implement a simple "squaring" function of one input argument to one output argument, your evaluation function might be:

```
void evaluateSquare(void *info, const float *inData, float *outData)
{
    outData[0] = inData[0] * inData[0];
}
```

**Availability**

Available in Mac OS X v10.2 and later.

**Declared In**

CGFunction.h

**CGFunctionReleaseInfoCallback**

Performs custom clean-up tasks when Quartz deallocates a CGFunction object.

```
typedef void (*CGFunctionReleaseInfoCallback) (
    void *info
);
```

If you name your function `MyCGFunctionReleaseInfo`, you would declare it like this:

```
void MyCGFunctionReleaseInfo (
    void *info
);
```

**Parameters***info*

The `info` parameter passed to [CGFunctionCreate](#) (page 6).

**Availability**

Available in Mac OS X v10.2 and later.

**Declared In**

CGFunction.h

## Data Types

**CGFunctionRef**

An opaque type that represents a callback function.

```
typedef struct CGFunction *CGFunctionRef;
```

**Availability**

Available in Mac OS X version 10.2 and later.

**Declared In**

CGFunction.h

**CGFunctionCallbacks**

A structure that contains callbacks needed by a CGFunction object.

```
struct CGFunctionCallbacks
{
    unsigned int version;
    CGFunctionEvaluateCallback evaluate;
    CGFunctionReleaseInfoCallback releaseInfo
};

typedef struct CGFunctionCallbacks CGFunctionCallbacks;
```

**Fields**

version

The structure version number. For this structure, the version should be 0.

evaluate

The callback that evaluates the function.

releaseInfo

If non-NULL, the callback used to release the `info` parameter passed to [CGFunctionCreate](#) (page 6).

**Availability**

Available in Mac OS X v10.2 and later.

**Declared In**

`CGFunction.h`

# Document Revision History

---

This table describes the changes to *CGFunction Reference*.

Date	Notes
2006-12-22	Made minor editorial changes.
2005-07-07	Added information to <code>CGFunctionCreate</code> .
2005-04-29	Revised introduction.
2004-02-26	First version of this document. An earlier version of this information appeared in <i>Quartz 2D Reference</i> .
