# ABAddressBook C Reference

---

<b>Derived From:</b>	CType
<b>Framework:</b>	AddressBook/ABAddressBookC.h
<b>Companion guide</b>	Address Book Programming Guide for Mac OS X
<b>Declared in</b>	ABAddressBookC.h ABGlobals.h ABTypeDefs.h

## Overview

The `ABAddressBook` opaque type provides a programming interface to the Address Book—a centralized database used by multiple applications to store contact and other personal information about people. The Address Book database also supports the notion of a “group” containing one or more persons. People may belong to multiple groups, and groups may also belong to other groups.

The `ABAddressBook` opaque type provides functions for accessing, adding, and removing group and person records including the “me” record corresponding to the logged-in user. For example, you use the [ABCopyArrayOfAllGroups](#) (page 7) function to get an array of all the group records in the database, or the [ABCopyArrayOfAllPeople](#) (page 7) function to get all the person records. You use the [ABGetMe](#) (page 10) function to get the person record corresponding to the logged-in user. You can also add and remove records using the [ABAddRecord](#) (page 6) and [ABRemoveRecord](#) (page 12) functions.

You can also search for records matching a particular query you specify by creating an `ABSearchElement` object. You use the `ABGroupCreateSearchElement` or `ABPersonCreateSearchElement` function to create an `ABSearchElement` object for the corresponding record. Then use the [ABCopyArrayOfMatchingValues](#) (page 8) `ABAddressBook` function, passing the `ABSearchElement` as the argument, to query the database. See `ABSearchElement` for more functions that create compound queries.

Your application uses a shared instance of `ABAddressBook` returned by the [ABGetSharedAddressBook](#) (page 11) function to interact with the database (multiple `ABAddressBook` instances are not supported). Changes you make to the record objects are stored in memory, and saved to disk when you invoke the [ABSave](#) (page 13) function.

The Address Book posts notifications if any application including yours makes changes to the database. Typically, you observe these notifications to update any dependent view or model objects in your application. Use `CFNotificationCenter` to register for the `ABAddressBook` notifications: [kABDatabaseChangedNotification](#) (page 17) and [kABDatabaseChangedExternallyNotification](#) (page 17). These notifications are not sent until [ABGetSharedAddressBook](#) (page 11) is called.

The `ABAddressBook` opaque type is “toll-free bridged” with its Objective-C counterpart. This means that the `ABAddressBookRef` type is interchangeable in function or method calls with instances of the `ABAddressBook` class.

## Functions

### ABAddPropertiesAndTypes

Adds the given properties to all the records of the specified type in the Address Book database, and returns the number of properties successfully added.

```
CFIndex ABAddPropertiesAndTypes (
    ABAddressBookRef addressBook,
    CFStringRef recordType,
    CFDictionaryRef propertiesAndTypes
);
```

#### Parameters

*addressBook*

The address book for the logged-in user.

*recordType*

The record type you wish to add properties to: `kABGroupRecordType` or `kABPersonRecordType`.

*propertiesAndTypes*

A `CFDictionary` object containing the properties to add. In each dictionary entry, the key is a string with the property’s name, and the value is a constant with the property’s type. The property’s name must be unique. You may want to use Java-style package names for your properties, for example, “org.dogclub.dogname” or “com.mycompany.customerID”. The property type must be one of the constants described in [Property Types](#) (page 15).

#### Return Value

The number of properties successfully added.

#### Availability

Available in Mac OS X v10.2 and later.

#### Declared In

`ABAddressBookC.h`

### ABAddRecord

Adds a record of the specified type to the Address Book database.

```
bool ABAddRecord (
    ABAddressBookRef addressBook,
    ABRecordRef record
);
```

#### Parameters

*addressBook*

The address book for the logged-in user.

*record*

The record to add to the Address Book database. If this parameter is `NULL`, the function raises an exception.

**Return Value**

`true` if the record was added successfully, `false` otherwise.

**Availability**

Available in Mac OS X v10.2 and later.

**Related Sample Code**

AddressBookCarbon

**Declared In**

ABAddressBookC.h

## ABCopyArrayOfAllGroups

Returns an array of all the groups in the Address Book database.

```
CFArrayRef ABCopyArrayOfAllGroups (
    ABAddressBookRef addressBook
);
```

**Parameters**

*addressBook*

The address book for the logged-in user.

**Return Value**

An array of `ABGroup` objects representing all the groups in the Address Book database. If the database doesn't contain any groups, the function returns an empty array. You are responsible for releasing this object.

**Availability**

Available in Mac OS X v10.3 and later.

**Declared In**

ABAddressBookC.h

## ABCopyArrayOfAllPeople

Returns an array of all the people in the Address Book database.

```
CFArrayRef ABCopyArrayOfAllPeople (
    ABAddressBookRef addressBook
);
```

**Parameters**

*addressBook*

The address book for the logged-in user.

**Return Value**

An array of `ABPerson` objects representing all the people in the Address Book database. If the database does not contain any people, the function returns an empty array. You are responsible for releasing this object.

**Availability**

Available in Mac OS X v10.3 and later.

**Declared In**

ABAddressBookC.h

**ABCopyArrayOfMatchingRecords**

Returns an array of records that match the given search element, or an empty array if no records match the search element.

```
CFArrayRef ABCopyArrayOfMatchingRecords (
    ABAddressBookRef addressBook,
    ABSearchElementRef search
);
```

**Parameters**

*addressBook*

The address book for the logged-in user.

*search*

The search element that specifies the query. If *search* is NULL, this function raises an exception.

Create an ABSearchElement object using the record specific functions:

ABGroupCreateSearchElement or ABPersonCreateSearchElement. See ABSearchElement for more functions that create compound queries.

**Return Value**

A new array containing ABRecord objects representing all the records that match *search*. If no records match *search*, this function returns an empty array. You are responsible for releasing this object.

**Availability**

Available in Mac OS X v10.2 and later.

**Related Sample Code**

AddressBookCarbon

**Declared In**

ABAddressBookC.h

**ABCopyArrayOfPropertiesForRecordType**

Returns an array containing the names of all the properties for the specified record type.

```
CFArrayRef ABCopyArrayOfPropertiesForRecordType (
    ABAddressBookRef addressBook,
    CFStringRef recordType
);
```

**Parameters**

*addressBook*

The address book for the logged-in user.

*recordType*

Specifies the type of record: kABGroupRecordType or kABPersonRecordType.

**Return Value**

An new array containing the names (CFString objects) of all the properties in *recordType*. You are responsible for releasing this object.

**Availability**

Available in Mac OS X v10.2 and later.

**Declared In**

ABAddressBookC.h

**ABCopyDefaultCountryCode**

Returns the default country code for records with unspecified country codes.

```
CFStringRef ABCopyDefaultCountryCode (
    ABAddressBookRef addressBook
);
```

**Parameters**

*addressBook*

The address book for the logged-in user.

**Return Value**

A string with the default country code. You are responsible for releasing this object.

**Availability**

Available in Mac OS X v10.3 and later.

**Declared In**

ABAddressBookC.h

**ABCopyRecordForUniqueId**

Returns the record that matches the given unique ID.

```
ABRecordRef ABCopyRecordForUniqueId (
    ABAddressBookRef addressBook,
    CFStringRef uniqueId
);
```

**Parameters**

*addressBook*

The address book for the logged-in user.

*uniqueId*

A unique ID for the record. If this is NULL, this function raises an exception.

**Return Value**

The record that matches the given unique ID. If no record matches *uniqueId*, the function returns NULL. You are responsible for releasing this object.

**Availability**

Available in Mac OS X v10.2 and later.

**Declared In**

ABAddressBookC.h

**ABCopyRecordTypeFromUniqueId**

Returns the type name of the record that matches a given unique ID.

```
CFStringRef ABCopyRecordTypeFromUniqueId (
    ABAddressBookRef addressBook,
    CFStringRef uniqueId
);
```

**Parameters***addressBook*

The address book for the logged-in user.

*uniqueId*

A unique ID for the record. If this is NULL, this function raises an exception.

**Return Value**

A string with the name of the type for the record that matches the given unique ID. You are responsible for releasing this object.

**Availability**

Available in Mac OS X v10.3 and later.

**Declared In**

ABAddressBookC.h

**ABCCreateFormattedAddressFromDictionary**

Returns a string containing the formatted address.

```
CFStringRef ABCCreateFormattedAddressFromDictionary (
    ABAddressBookRef addressBook,
    CFDictionaryRef address
);
```

**Parameters***addressBook*

The address book for the logged-in user.

**Return Value**

Returns a string containing the formatted address. You are responsible for releasing this object.

**Availability**

Available in Mac OS X v10.3 and later.

**Declared In**

ABAddressBookC.h

**ABGetMe**

Returns the ABPerson object for the logged-in user.

```
ABPersonRef ABGetMe (
    ABAddressBookRef addressBook
);
```

**Parameters**

*addressBook*

The address book for the logged-in user.

**Return Value**

The ABPerson record that represents the logged-in user, or NULL if the user never specified such a record. You are responsible for retaining and releasing this object as needed.

**Availability**

Available in Mac OS X v10.2 and later.

**Related Sample Code**

MyFirstJNIProject

**Declared In**

ABAddressBookC.h

**ABGetSharedAddressBook**

Returns the unique shared ABAddressBook object.

```
ABAddressBookRef ABGetSharedAddressBook (
    void
);
```

**Return Value**

The address book for the logged-in user. You are responsible for retaining and releasing this object as needed.

**Discussion**

Every application shares the address book for the logged-in user and this function returns it. If you call this function more than once or try to create a new address book, you get a pointer to the same shared address book.

**Availability**

Available in Mac OS X v10.2 and later.

**Related Sample Code**

AddressBookCarbon

MyFirstJNIProject

**Declared In**

ABAddressBookC.h

**ABHasUnsavedChanges**

Returns whether if there are unsaved changes in the address book.

```
bool ABHasUnsavedChanges (
    ABAddressBookRef addressBook
);
```

**Parameters**

*addressBook*

The address book for the logged-in user.

**Return Value**

true if there are unsaved changes, false otherwise.

**Discussion**

The unsaved changes flag is set automatically whenever changes are made to the address book.

**Availability**

Available in Mac OS X v10.2 and later.

**Declared In**

ABAddressBookC.h

**ABRemoveProperties**

Removes the given properties from all the records of this type in the Address Book database, and returns the number of properties successfully removed.

```
CFIndex ABRemoveProperties (
    ABAddressBookRef addressBook,
    CFStringRef recordType,
    CFArrayRef properties
);
```

**Parameters**

*addressBook*

The address book for the logged-in user.

*recordType*

The name of record to remove the properties from: kABGroupRecordType or kABPersonRecordType.

*properties*

An array of properties (CFString objects) to remove.

**Return Value**

The number of properties successfully removed.

**Availability**

Available in Mac OS X v10.2 and later.

**Declared In**

ABAddressBookC.h

**ABRemoveRecord**

Removes the specified record from the Address Book database.

```
bool ABRemoveRecord (
    ABAddressBookRef addressBook,
    ABRecordRef record
);
```

**Parameters**

*addressBook*

The address book for the logged-in user.

*record*

The ABRecord object to be removed. If NULL, this function raises an exception.

**Return Value**

true if the record was removed successfully, false otherwise.

**Availability**

Available in Mac OS X 10.2 and later.

**Declared In**

ABAddressBookC.h

**ABSave**

Saves all the changes made since the last save.

```
bool ABSave (
    ABAddressBookRef addressBook
);
```

**Parameters**

*addressBook*

The address book for the logged-in user.

**Return Value**

true if this function is successful or if there were no changes, false otherwise.

**Availability**

Available in Mac OS X v10.2 and later.

**Related Sample Code**

AddressBookCarbon

**Declared In**

ABAddressBookC.h

**ABSetMe**

Sets the record that represents the logged-in user.

```
void ABSetMe (
    ABAddressBookRef addressBook,
    ABPersonRef moi
);
```

**Parameters***addressBook*

The address book for the logged-in user.

*person*

The ABPerson object that represents the logged-in user. Pass NULL if you don't want a record to represent the logged-in user.

**Availability**

Available in Mac OS X v10.2 and later.

**Declared In**

ABAddressBookC.h

**ABTypeOfProperty**

Returns the type of a given property for a given record.

```
ABPropertyType ABTypeOfProperty (
    ABAddressBookRef addressBook,
    CFStringRef recordType,
    CFStringRef property
);
```

**Parameters***addressBook*

The address book for the logged-in user.

*recordType*The record type that contains *property*: kABGroupRecordType or kABPersonRecordType.*property*

The property whose type you wish to obtain.

**Return Value**The type of *property* as defined in [Property Types](#) (page 15). If *property* does not exist in *recordType*, this function returns kABErrorInProperty.**Availability**

Available in Mac OS X v10.2 and later.

**Declared In**

ABAddressBookC.h

## Data Types

**ABAddressBookRef**

A reference to an ABAddressBook object.

```
typedef struct __ABAddressBookRef *ABAddressBookRef;
```

**Availability**

Available in Mac OS X v10.2 and later.

**Declared In**

ABAddressBookC.h

## Constants

### Property Types

These are the possible types of ABRecord properties.

```
typedef enum _ABPropertyType {
    kABErrorInProperty = 0x0,
    kABStringProperty = 0x1,
    kABIntegerProperty = 0x2,
    kABRealProperty = 0x3,
    kABDateProperty = 0x4,
    kABArrayProperty = 0x5,
    kABDictionaryProperty = 0x6,
    kABDataProperty = 0x7,
    kABMultiStringProperty = 0x100 | kABStringProperty,
    kABMultiIntegerProperty = 0x100 | kABIntegerProperty,
    kABMultiRealProperty = 0x100 | kABRealProperty,
    kABMultiDateProperty = 0x100 | kABDateProperty,
    kABMultiArrayProperty = 0x100 | kABArrayProperty,
    kABMultiDictionaryProperty = 0x100 | kABDictionaryProperty,
    kABMultiDataProperty = 0x100 | kABDataProperty
} ABPropertyType;
```

**Constants**

kABErrorInProperty

Returned by some functions when an invalid property is used.

Available in Mac OS X v10.2 and later.

Declared in ABTypedefs.h.

kABStringProperty

Indicates a CFString object.

Available in Mac OS X v10.2 and later.

Declared in ABTypedefs.h.

kABIntegerProperty

Indicates a CFNumber object representing an integer.

Available in Mac OS X v10.2 and later.

Declared in ABTypedefs.h.

kABRealProperty

Indicates a CFNumber object representing a real number.

Available in Mac OS X v10.2 and later.

Declared in ABTypedefs.h.

`kABDateProperty`

Indicates a `NSDate` object.

Available in Mac OS X v10.2 and later.

Declared in `ABTypeDefs.h`.

`kABArrayProperty`

Indicates a `NSArray` object.

Available in Mac OS X v10.2 and later.

Declared in `ABTypeDefs.h`.

`kABDictionaryProperty`

Indicates a `NSDictionary` object.

Available in Mac OS X v10.2 and later.

Declared in `ABTypeDefs.h`.

`kABDataProperty`

Indicates a `NSData` object.

Available in Mac OS X v10.2 and later.

Declared in `ABTypeDefs.h`.

`kABMultiStringProperty`

Indicates an `ABMultiValue` containing `NSString` objects.

Available in Mac OS X v10.2 and later.

Declared in `ABTypeDefs.h`.

`kABMultiIntegerProperty`

Indicates an `ABMultiValue` containing `NSNumber` objects representing integers.

Available in Mac OS X v10.2 and later.

Declared in `ABTypeDefs.h`.

`kABMultiRealProperty`

Indicates an `ABMultiValue` containing `NSNumber` objects representing real numbers.

Available in Mac OS X v10.2 and later.

Declared in `ABTypeDefs.h`.

`kABMultiDateProperty`

Indicates an `ABMultiValue` containing `NSDate` objects.

Available in Mac OS X v10.2 and later.

Declared in `ABTypeDefs.h`.

`kABMultiArrayProperty`

Indicates an `ABMultiValue` containing `NSArray` objects.

Available in Mac OS X v10.2 and later.

Declared in `ABTypeDefs.h`.

`kABMultiDictionaryProperty`

Indicates an `ABMultiValue` containing `NSDictionary` objects.

Available in Mac OS X v10.2 and later.

Declared in `ABTypeDefs.h`.

`kABMultiDataProperty`

Indicates an `ABMultiValue` containing `NSData` objects.

Available in Mac OS X v10.2 and later.

Declared in `ABTypedefs.h`.

## Database Notifications

These are notifications published when something changes in the Address Book database. These notifications are not sent until [ABGetSharedAddressBook](#) (page 11) has been called.

```
CFStringRef kABDatabaseChangedNotification;
```

```
CFStringRef kABDatabaseChangedExternallyNotification;
```

### Constants

`kABDatabaseChangedNotification`

This process has changed the AddressBook database.

Available in Mac OS X v10.2 and later.

Declared in `ABGlobals.h`.

`kABDatabaseChangedExternallyNotification`

Another process has changed the AddressBook database. The following keys are included in the user-info dictionary of the notification: `kABInsertedRecords`, `kABUpdatedRecords`, and `kABDeletedRecords`. If the values for all the keys are `nil`, everything has changed, such as when the Address Book database is restored from a backup copy.

Available in Mac OS X v10.2 and later.

Declared in `ABGlobals.h`.

# Document Revision History

---

This table describes the changes to *ABAddressBook C Reference*.

Date	Notes
2007-07-08	Updated for Mac OS X v10.5.
2006-05-23	Corrected typos.
2005-08-11	Corrected <code>ABCreateFormattedAddressFromDictionary</code> function result information.
2003-08-20	Revised for Mac OS X v10.3.
	Changed <code>ABCreateArrayOfAllGroups</code> to <code>ABCopyArrayOfAllGroups</code> (page 7). The former has been removed.
	Changed <code>ABCreateArrayOfAllPeople</code> to <code>ABCopyArrayOfAllPeople</code> (page 7). The former has been removed.
2003-03-01	First version of <i>ABAddressBook Reference for C</i> .
