ABMultiValue Class Objective-C Reference

| | |
|------------------------|---|
| Inherits from | NSObject |
| Conforms to | NSCopying NSMutableCopying NSFastEnumeration NSObject (NSObject) |
| Framework | /System/Library/Frameworks/AddressBook.framework |
| Availability | Available in Mac OS X v10.2 and later. |
| Companion guide | Address Book Programming Guide for Mac OS X |
| Declared in | ABMultiValue.h |

Overview

The `ABMultiValue` and `ABMutableMultiValue` classes are used to represent properties that might have multiple values. Each value in a multi-value list must be the same type, and has an associated pre-defined or user-defined label, and unique identifier. The labels, however, need not be unique. For example, you can have multiple “Home” phone numbers. Each multi-value object may have a primary identifier—used as a default value when a label is not provided. For example, a person record may have multiple addresses with the labels “Home” and “Work”, where “Work” is designated as the primary value. Instances of this class are immutable, see `ABMutableMultiValue` for methods that manipulate the content of a multi-value list.

You can access values using a numeric index (similar to an array). Use the [`identifierAtIndex:`](#) (page 7) method to get an identifier, the [`labelAtIndex:`](#) (page 7) method to get a label, and the [`valueAtIndex:`](#) (page 9) method to get a value. However, a numeric index is temporary since a multi-value list may change. Each value or entry in a multi-value list has a unique identifier which can be used to save a reference to a specific value—the identifier is guaranteed never to change.

Use the [`primaryIdentifier`](#) (page 8) method to get the primary identifier (the identifier associated with the primary value).

The `ABMultiValue` class is “toll-free bridged” with its procedural C, opaque type, counterpart. This means that the `ABMultiValueRef` type is interchangeable in function or method calls with instances of the `ABMultiValue` class.

Tasks

Accessing the Primary Identifier

- [primaryIdentifier](#) (page 8)

Accessing Identifiers

- [identifierAtIndex:](#) (page 7)
- [indexForIdentifier:](#) (page 7)

Accessing Entries

- [labelAtIndex:](#) (page 7)
- [valueAtIndex:](#) (page 9)
- [valueForIdentifier:](#) (page 9)
- [labelForIdentifier:](#) (page 8)

Querying the List

- [count](#) (page 6)
- [propertyType](#) (page 8)

Instance Methods

count

- (NSUInteger)count

Discussion

Returns the number of entries in a multi-value list.

Availability

Available in Mac OS X v10.2 and later.

Declared In

ABMultiValue.h

identifierAtIndex:

- (NSString *)identifierAtIndex:(NSUInteger) *index*

Discussion

Returns the identifier for the given index. If the *index* argument is out of bounds, this method raises an exception.

Availability

Available in Mac OS X v10.2 and later.

See Also

- [indexOfIdentifier:](#) (page 7)

Declared In

ABMultiValue.h

indexOfIdentifier:

- (NSUInteger)indexOfIdentifier:(NSString *) *identifier*

Discussion

Returns the index for the given identifier. Returns `NSNotFound` if the identifier is not found.

Availability

Available in Mac OS X v10.2 and later.

See Also

- [identifierAtIndex:](#) (page 7)

Declared In

ABMultiValue.h

labelAtIndex:

- (NSString *)labelAtIndex:(NSUInteger) *index*

Discussion

Returns the label for the given index. If the *index* argument is out of bounds, this method raises an exception.

Availability

Available in Mac OS X v10.2 and later.

See Also

- [labelForIdentifier:](#) (page 8)

Declared In

ABMultiValue.h

labelForIdentifier:

- (id)labelForIdentifier:(NSString *)*identifier*

Discussion

Returns the label for the given identifier. Returns `nil` if the identifier is not found.

Availability

Available in Mac OS X v10.5 and later.

See Also

- [labelAtIndex:](#) (page 7)

Declared In

ABMultiValue.h

primaryIdentifier

- (NSString *)primaryIdentifier

Discussion

Returns the identifier for the primary value.

Availability

Available in Mac OS X v10.2 and later.

See Also

- [indexForIdentifier:](#) (page 7)
- [setPrimaryIdentifier:](#) (ABMutableMultiValue)

Declared In

ABMultiValue.h

propertyType

- (ABPropertyType)propertyType

Discussion

Returns the type for the values in a multi-value list. If the multi-value list is empty or its values are of different types, it returns `kABErrorInProperty`.

Availability

Available in Mac OS X v10.2 and later.

Declared In

ABMultiValue.h

valueAtIndex:

- (id)valueAtIndex:(NSUInteger)*index*

Discussion

Returns the value for the given index. If the *index* argument is out of bounds, this method raises an exception.

Availability

Available in Mac OS X v10.2 and later.

See Also

- [valueForIdentifier:](#) (page 9)

Declared In

ABMultiValue.h

valueForIdentifier:

- (id)valueForIdentifier:(NSString *)*identifier*

Discussion

Returns the value for the given identifier. Returns `nil` if the identifier is not found.

Availability

Available in Mac OS X v10.5 and later.

See Also

- [valueAtIndex:](#) (page 9)

Declared In

ABMultiValue.h

Document Revision History

This table describes the changes to *ABMultiValue Class Objective-C Reference*.
